

Elon Musk reportedly planning xAI Supercomputer powered by NVIDIA GPUs

Elon Musk reportedly informed investors this month that his startup, xAI, aims to make a supercomputer by fall 2025, which would support a more advanced version of its Grok chatbot. Musk described this supercomputer as a “gigafactory of compute,”

reports The Information (via Engadget). This supercomputer would utilise tens of thousands of NVIDIA H100 GPUs and require billions of dollars to construct. Previously, Musk stated that the third version of Grok would necessitate a minimum of 100,000 of

the chips — a significant jump from the 20,000 GPUs reportedly utilised for training Grok 2.0. In the presentation, Musk also informed investors that the planned GPU cluster would be at least four times larger than anything currently used by xAI’s competitors.

In related news, last month, xAI introduced the Grok-1.5 Vision or Grok-1.5V AI model. Grok-1.5V is the company’s first multimodal model. With Grok-1.5V, the AI chatbot can understand a wide variety of visual information, including documents, diagrams, charts, screenshots and photographs.

According to the company, the Grok-1.5V’s performance surpasses that of its peers in xAI’s new RealWorldQA benchmark. For those who are unaware, xAI’s RealWorldQA benchmark is designed to evaluate basic real-world spatial understanding capabilities of multimodal models. In the coming months, xAI plans to make significant improvements in both capabilities across various modalities such as images, audio, and video.

How Indian doctors used Apple Vision Pro in a Bariatric Surgery

The Apple Vision Pro has been the talk of the town ever since it was released last year. The internet went gaga over it and rightly so, this was something new and unique. We saw people on social media using it for various purposes. However, in India, it has made its way to an Operation Theatre. Yes! Doctors performed a surgery wearing the Apple Vision Pro. How did it help them and what happened?

What’s the story?

For the uninitiated, the Apple Vision Pro is an augmented reality (AR) device. In New Delhi, at the Pristyn Care surgical centre on May 17th, doctors used the Vision Pro during a live bariatric surgery. The patient was suffering from

obstructive sleep apnea and high blood pressure. He had to undergo a sleeve gastric bypass and a Single Anastomosis Duodenal-Ileal (SADI) procedure. This procedure lasted for 40 minutes and it was conducted under the leadership of Dr. Mohit Bhandari, a leading bariatric surgeon.

How did the Apple Vision Pro help doctors?

The Vision Pro helped the doctors by providing them with an immersive and interactive 3D environment. Further, it helped the doctors in visualising complex anatomical structures with more clarity. This offered more precision, and limited risks and mistakes. <https://bit.ly/4bMCEGQ>
