NVIDIA's G-Assist AI to enhance PC gaming

PC games provide expansive worlds to explore and complex mechanics to challenge even the most devoted gamers. Many of us invest hours searching the internet for help to learn and excel in our favourite titles. The wealth of knowledge available is vast, encompassing millions of guides and countless words. At Computex 2024, Nvidia introduced Project G-Assist, an AI assistant for PC apps and games.

NVIDIA's Project G-Assist is an RTX-powered AI assistant technology demo that provides context-aware help for PC games and apps. This AI assistant aims to put game and system knowledge at players' fingertips. You just have to ask a question about your game or system performance, and the AI assistant provides context-aware answers. Project G-Assist can also describe various settings and their expected impact on performance. For example, it can explain the difference between DLAA and DLSS, as well as the distinctions between Ultra Low Latency Mode in the Nvidia Control Panel and Nvidia Reflex in-game.

OpenAI launches ChatGPT Edu for universities

OpenAI has introduced ChatGPT Edu, a new version of ChatGPT designed for universities to integrate AI into student, faculty, researcher, and campus operations. Leveraging the power of GPT-4o, ChatGPT Edu can reason across both text and visuals and utilise advanced tools like data analysis. This new service provides enterprise-level security and controls and is priced to be accessible to educational institutions. In a blogpost, OpenAI explained that it built ChatGPT Edu because the company saw the success universities like the University of Oxford, Wharton School of the University of Pennsylvania, University of Texas at Austin, Arizona State University, and Columbia University in the City of New York were having with ChatGPT Enterprise. <https://bit.ly/3Kr10Ka>

Truecaller adds new AI Call Scanner

In today's tech-savvy world, scam calls and fake voices are becoming increasingly common. To combat this, Truecaller has introduced AI Call Scanner, a feature that can distinguish between real human voices and AI-generated ones. With AI Call Scanner, you can chat confidently, knowing that the person on the other end is genuine and not a scammer trying to deceive you.
