

as some of the current and older WD SSDs would mean that most of the product differentiation is happening

at the software level. So how well has WD tuned the SN580? We'd say that it is average at best. Starting off with

throughput, we can see the SN580 easily hit the specified speeds in CrystalDiskMark. We managed to get about 4198 MB/s for sequential read operations and 4144 MB/s for sequential write operations. Among all the PCIe Gen 4.0 SSDs, this falls very low on the list of top performers. However, when it comes to random 4K read performance, then the SN580 with about 98 MB/s comes out right in the middle of the bell curve.

Latency-wise, the SN580 is pretty good. It's very close to the SN770 which is another DRAM-less SSD from WD which lies in their premium WD_Black segment. It too uses the same controller and NAND as the SN580. Moving onto power consumption, the SN580 peaks out at about 3.5 Watts which is also quite average. In fact, the previous gen SN570 consumed a little less than the SN580.

VERDICT

You can get the WD Blue SN580 for about INR 6000 on popular eCommerce platforms specialising in PC parts. That brings the cost-per-GB down to INR 5.9 which is quite decent. However, when you look at alternatives in the market you'll come across options such as the Crucial P3 Plus which offers higher read speeds and slightly less write speeds, and is a tad bit cheaper. So there's nothing that compelling which makes the WD Blue SN580 stand out from the competition. It's an average drive because it was particularly designed to be so. If you're looking for some cheap SSD storage in lieu of a hard drive, then the WD Blue SN580 is an option worth considering among the many others that lie in the segment.
