

Realme GT 6T

Good value, quirky design

A moment of rejoice for people who liked Realme's GT series of flagship and mid-range smartphones (I am one of them) as the Realme GT series is officially back in India. This year, Realme is debuting its top-of-the-line GT series with a mid-range smartphone, the Realme GT 6T.

The Realme GT 6T has been launched in India at a price of about Rs 30,000 or just below (with the launch discounts). For that price, the specs on the Realme GT 6T are very good. We are getting a brand new Qualcomm Snapdragon 7+ Gen 3 chipset, a 5,500mAh battery with 120W fast charging, an LTPO AMOLED display, up to 512GB of internal storage, along with other things. So on paper, the Realme GT 6T looks like a solid deal. But how good is the smartphone in real life? Let's find out.

DESIGN

Design of the Realme GT 6T is nothing special. Of course, adding the curved front and back does offer a premium feel to the smartphone, but I really don't like how the back panel looks. The curved back is nice and offers a good grip on the smartphone, but the silver strip, which Realme is calling a "Nano Mirror Design" is not something that will appeal to a user like myself. Now since I'm not the only kind of buyer in the market, this would appeal to a lot of users.

The chrome strip that runs across the camera cutouts on the back panels will scratch very easily and is very prone to getting finger smudges. Even with the silicon cover that Realme is shipping inside the box, the silver strip remains exposed. Further, with the camera and flash cutouts placed so close to each other, the small gaps can gather dust

₹33,999

and it is very difficult to clean those small gaps.

Apart from that, the design is simple. The curved front panel has a hole punch cutout for the selfie shooter. We get a flattened plastic frame and a plastic back on the Realme GT 6T, which keeps the weight in

check (191 grams).

Now, there are some very good things about the design as well. In terms of durability, we are getting Corning Gorilla Glass Victus 2 for scratches and the Realme GT 6T also comes with IP65 rating for dust and water resistance, which is always good. For a mid-range smartphone, this level of protection is much appreciated.

So in terms of design, my review is mixed. While I may not like the look of the smartphone, there are enough positives despite not liking the design myself.

DISPLAY

Coming to the display, here also things are rather impressive. Firstly, this is probably one of the first mid-range

smartphones to come with an LTPO AMOLED display so that is good. Furthermore, Realme is claiming a peak brightness of up to 6,000 nits. That is one of the highest numbers that I have personally seen on any smartphone at least on the spec sheet. In reality, however, things aren't as impressive. Now, the 6,000 nits isn't the whole display's luminance, but the brightest 1 percent of the Realme GT 6T's display.

But it's nothing too bad. I tested the brightness using a Lux Meter on the Realme GT 6T's display and the smartphone showcased 1,444 nits of peak luminance under bright sunlight. This basically means that the sunlight visibility of the Realme GT 6T is very good and you will have no issues using this smartphone in any kind of environment.

The Realme GT 6T also offers an LTPO panel, which means that the display will adjust the refresh rate according to the content on screen. It supports up to 120Hz refresh rate so yes, every swipe and gesture on this display is absolutely smooth and slick. This not only makes scrolling through windows and apps smoother, it also enables high FPS gaming on the Realme GT 6T.

The colours on the other hand are vibrant. I wasn't able to test the accuracy of the colours, but this display is said to have 100% DCI-P3 coverage, meaning that the colours are represented at a certain level of accuracy. We further get colour profiles to adjust colours on the display according to the user's taste and preference. There are 5 different colour profiles on the Realme GT 6T including "vivid," "natural," "Pro," "cinematic," and "brilliant." Along with these, you can also choose from a warmer or a colder colour setting.

So the display on the Realme GT 6T is very good. I honestly liked the way it performs. The only thing that could be a bit of a miss is the lack of major HDR certifications, but apart from that it does a lot of things better than some of the biggest competitors in this range.

PERFORMANCE

So the Realme GT 6T is the first
