

TEACHER

WHAT'S RIGHT, WHAT'S WRONG?

USE CASES FOR TEACHERS

1. AUTOMATED GRADING:

Tools like **Turnitin** and **Grammarly** can automate grading, saving teachers time and providing instant feedback to students. To implement this, teachers can integrate these tools into their Learning Management System (LMS) and guide students on how to submit assignments through these platforms.

4. PREDICTIVE ANALYSIS:

AI can predict students' performance based on their past performance and learning behaviour. **BrightBytes** is an AI tool that provides predictive analytics in education. Teachers can use these insights to identify students who might need extra attention.

2. PERSONALISED LEARNING:

AI can create personalised learning plans for each student. **Knewton** is an AI tool that provides adaptive learning paths. Teachers can use this tool to track students' progress and adjust their teaching methods accordingly to ensure better results overall.

5. PROFESSIONAL DEVELOPMENT:

AI can provide personalised professional development courses for teachers. **LinkedIn Learning** uses AI to recommend courses based on a teacher's profile and interests. Teachers can use this platform to learn about the latest teaching methodologies and technologies.

3. VIRTUAL TEACHING ASSISTANTS:

AI-powered virtual assistants like **IBM Watson** can answer students' queries and assist in conducting online classes. Teachers can use these assistants to handle routine queries, freeing up their time to focus on more complex student interactions.

6. WORK-LIFE BALANCE:

AI can help teachers manage their time and tasks more effectively. AI-powered tools like **Google Assistant** or **Amazon's Alexa** can help in setting reminders, scheduling tasks, and even controlling smart home devices.
