

# GRAPHIC DESIGNER

MAKING A DIFFERENCE, ONE PIXEL AT A TIME

## USE CASES FOR GRAPHIC DESIGNERS

### 1. STYLE TRANSFER:

AI can create unique designs by applying the style of one image to another. Tools like **DeepArt** and **Prisma** use AI for this purpose. You simply select the style image and the target image, and the AI will apply the style to the target.

### 4. PERSONALIZED DESIGNS:

AI can create personalized designs based on user data. Tools like **Optimizely** and **Dynamic Yield** provide personalization capabilities. You input the user data, and the AI will create a design that is personalized for each user.

### 2. LAYOUT OPTIMIZATION:

AI can suggest optimal layouts based on the content and design principles. Tools like **Adobe Sensei** provide these capabilities. You input your content, and the AI will suggest a layout that is visually pleasing and effective.

### 5. TREND PREDICTION:

AI can analyze design trends and predict future trends. Tools like **WGSN** provide trend forecasting. You can use these predictions to create designs that are current and relevant.

### 3. CONTENT-AWARE FILL:

AI can intelligently fill in the gaps in an image when a part is removed. Adobe's **Content-Aware Fill** in Photoshop uses AI for this purpose. You select the part of the image you want to remove, and the AI will fill in the gap in a way that matches the rest of the image.

### 6. COLORIZATION:

AI can add color to black and white images or change the color scheme of an image. Tools like **DeOldify** and **Algorithmia** provide these capabilities. You upload the black and white image, and the AI will add color based on its understanding of the image content.
