

- smartphones and laptops to smart homes, intelligent IoT in businesses, and smart vehicles. At the heart of its innovation is the AI Processing Unit (APU) with Deep Learning Accelerators (Performance Cores), Visual Processing Units (Flexible Cores), hardware-based, multicore scheduler, and software development kits (NeuroPilot) acting as its core components.

MediaTek's AI chipsets for smartphones now allow several capabilities like creating avatars that mirror users' facial expressions and gestures in real time, offering advanced photo editing tools, creating summary from complex documents, and more. MediaTek research is extensively focusing on Edge AI to facilitate large computations required by Large Language Model (LLM) to happen locally, thereby

enhancing efficiency and user privacy. Another sector of focus is automotive, where complex neural networks need to be analysed to deliver real-time insights to the driver. Moreover, In 2024, MediaTek led India's smartphone chipset market with 53% share in Q1.

Recently MediaTek has launched MediaTek Dimensity 9300+ to accelerate on-device generative AI processing and offering broader support for LLMs. The new MediaTek Dimensity 9300+ is ideal for a wide range of AI applications that supports on-device LoRA Fusion and NeuroPilot LoRA Fusion 2.0 so developers can quickly bring to market new generative AI applications with text, images, music, and more.

MediaTek is uniquely positioned to drive the adoption of Generative AI

applications and technologies, whether deployed on the cloud, at the edge in devices, or as a hybrid approach that takes advantage of both the cloud and the edge together.

To conclude, India has the potential to become a global leader in AI technologies and applications. Investment in infrastructure, workforce and R&D are crucial to make the dreams into reality. This happens only through the right intervention by all stakeholders. Public-private partnerships and a focus on AI education are important to create a skilled workforce capable of driving tomorrow's tech development. Through these concerted efforts, India can harness AI to accelerate economic growth, improve digital inclusion, and establish itself as a leading force in the global technology landscape. **d**

Copiloting the Era of Intelligent Workplaces

what seemed like a futuristic dream to tangible reality. Microsoft and LinkedIn's Work Trend Index 2024 finds that 92% of knowledge workers in India are using AI for work, versus 75% globally, signaling a significantly higher adoption. The data is clear-The future of work powered by AI is here, making this the new normal of work.

With copilots at work, employees are discovering the joys of focusing on work that matters, having more time for creativity, innovation and a copilot to help them with time-

guzzling mundane tasks. These intelligent assistants can navigate through large amounts of data swiftly, draft reports at a fraction of the time, and provide creative insights that can turn an ordinary project into an exceptional one.

By handling mundane tasks with unprecedented speed, they free up time for workers to focus on what truly matters: innovation and creativity. And by changing the dynamics of work, these AI assistants are re-writing the rules of the game – they are changing the way people think

Until recently, the notion of every individual having a personal assistant to significantly enhance productivity was wishful thinking at best. With generative AI and copilots, however, the last year has transformed
