

iOS 18 introduces Apple Intelligence, Passwords App & more

At the Worldwide Developers Conference (WWDC) 2024, Apple unveiled iOS 18 with a host of new features. iOS 18 introduces new customisation options, the biggest redesign ever of the Photos app, Apple Intelligence and so much more.

New customisation options

iOS 18 introduces new customisation options for the Home Screen, Lock Screen, and Control Center. Users can arrange apps and widgets anywhere on the Home Screen. It also offers quicker access to frequently used controls, allows adding third-party app controls, and lets users customise the layout and size of controls.

Apple Intelligence

iOS 18 introduces Apple Intelligence, that combines the power of generative models with personal context. Apple Intelligence offers new ways for users to enhance their writing and communicate more effectively. New systemwide Writing Tools built in iOS 18 let users rewrite, proofread, and summarize text in apps like Mail and Notes.

Passwords App

iOS 18 introduces a new Passwords app. This new app simplifies access to passwords, passkeys, Wi-Fi passwords, and verification codes. It also alerts users to common weaknesses, like easily guessed or reused passwords, and those found in known data leaks.

Redesigned Photos app

Photos gets its biggest-ever redesign, featuring a simplified single view with a familiar grid and new themed collections that don't require manual organisation. Users can pin their favourite collections for easy access. A new carousel view highlights favourite people, pets, and places, updating daily.

Updates to iMessage

iMessage in iOS 18 introduces new text effects, allowing users to animate letters, words, phrases, or emojis. Users can format text with bold, underline, italics, and strikethrough, and expand Tapbacks to any emoji or sticker. Also, with the update, messages can now be scheduled for later.

Updates to Safari

With iOS18, Safari offers an easier way to discover information on the web with Highlights and a redesigned Reader experience. Using machine learning, Safari can surface key information about a webpage. For example, users can review a summary to get the gist of an article, quickly see the location of a restaurant, and more articles.

New Privacy Features

iOS 18 enhances user control with tools to manage app visibility, contact sharing, and accessory connections. Users can lock or hide apps in a secure folder, ensuring private content stays hidden from search and notifications. Specific contacts can be shared with apps, and devs can connect third-party accessories without exposing other devices.

Availability

The developer beta of iOS 18 is currently available through the Apple Developer Program at developer.apple.com, and a public beta will be available through the Apple Beta Software Program next month at beta.apple.com. iOS 18 will be available this fall as a free software update for iPhone Xs and later. More on Apple Intelligence next.
