

What is Apple Intelligence?

Everything you need to know

Apple kickstarted the WWDC 2024 with an almost 2-hour long Keynote session on Day 1. For the initial hour, Apple did not talk about artificial intelligence, but in the second half they introduced AI, nope AI here stands for “Apple Intelligence”. Quite Apple-like behaviour, I must say. Anywho, what is this Apple Intelligence? For starters, Apple Intelligence is Apple’s step forward toward AI. It is an answer to all the competition. It will be made available across platforms via iOS 18, iPadOS 18, and MacOS Sequoia.

includes a lot of generative AI features that we have previously seen on Google and Microsoft, an improved Siri, and ChatGPT integration are all part of it.

Along with all this, Apple has made sure to make the AI experience safer for everyone. Apple has highly focused on privacy along with AI. It claims that it has made sure that using Apple Intelligence is a secure experience

for everyone and user data is not shared unnecessarily, even with Apple itself.

Next, Apple informed us that most of the Apple Intelligence features will run on the device itself. However, if needed, it also has a Power Cloud Compute. This will allow for cloud power without sharing data on multiple servers and platforms.

ChatGPT and more features

For starters, an enhanced Siri and ChatGPT integration are also a part of Apple Intelligence but we will talk about them in-depth later.

There are some other AI features that I found really interesting such as Writing Tools, Genmoji, Image Wand, Custom Memory Movies, and Image Playground.

Apple Intelligence compatibility & availability

Now this one’s a bummer! Apple Intelligence features will be first rolled out in beta version this fall and in the US first.

However, it will only be compatible with some Apple devices such as iPhone 15 Pro Max, iPhone 15 Pro, iPad Pro (M1 and later), iPad Air (M1 and later), MacBook Air (M1 and later), MacBook Pro (M1 and later), iMac (M1 and later), Mac Mini (M1 and later), Mac Studio (M1 Max and later), and Mac Pro (M2 Ultra), as stated by Apple.

What is it?

In simple terms, it is a multimodal, cross-platform approach to today’s AI computing trend. Apple Intelligence

RCS support added to iPhones with iOS 18

Finally no blue bubble green bubble divide?

At the Worldwide Developers Conference (WWDC) 2024, Apple previewed iOS 18 with a host of new features. iOS 18 will arrive this fall. iOS 18 introduces new customisation options, the biggest redesign ever of the Photos app, Apple Intelligence and so much more. Among the new features of iOS 18 include support for Rich Communication Services (RCS) messaging.

After the WWDC 2024 keynote, Apple shared the iOS 18 Preview on its official website, showcasing the debut of RCS on iPhones. As depicted in the screenshot below, RCS maintains the green bubbles, signalling communication with Android users. Notable difference is

the tag “Text Message • RCS” within the chat interface. Additionally, Apple disclosed that Read Receipts would become available with the implementation of RCS in iOS 18.

Apple said that when messaging contacts who do not have an Apple device, the Messages app will support RCS for richer media and more reliable group messaging compared to SMS and MMS. It’s unlikely that pressure campaigns from Google and Samsung were the sole factors driving Apple’s decision to adopt RCS. One significant factor of bringing RCS support to iPhone could have been an attempt to address concerns from EU regulators.
