

■ SOCIAL MEDIA

You can now limit your Instagram Lives to Close Friends

Instagram has always been at the forefront of enhancing user experience with innovative features. In its latest announcement, the Meta-owned social media platform has introduced a game-changing option for its live feature: the ability to limit your Instagram live broadcasts to your Close Friends list. This feature empowers users to share

live moments with a select, trusted audience, ensuring a more intimate and controlled interaction. For those who are unaware, until now, starting a live broadcast on Instagram meant that anyone could watch it if your account was public, and all your followers could tune in if your account was private. <https://bit.ly/3zrko7r>

■ EMAIL SERVICES

Security bug enables impersonation of Microsoft employee emails

In the ever-evolving landscape of cybersecurity threats, a disturbing discovery has come to light: a bug allowing individuals to impersonate Microsoft corporate email accounts has been found by a researcher. This bug not only raises serious concerns about the integrity of digital communications but also underscores the critical need for robust cybersecurity measures in today's interconnected world. As businesses and individuals alike rely heavily on email for communication and operations, the implications of such a flaw are dangerous, potentially paving the way for phishing attacks and data breaches. <https://bit.ly/3zrkjD>

Now you can use Canva from other apps!

Canva, the popular platform known for making design easy, has just launched its new Canva Connect APIs. These new APIs will help businesses by allowing them to integrate Canva directly into the tools they already use. This means teams can work on designs together without having to constantly switch between different apps.

At Canva Create 2024, the company made several major announcements including these new Connect APIs which are a part of Canva's ongoing mission to make design more accessible for everyone. With these APIs, businesses can seamlessly integrate Canva into their existing platforms.

New 'ClickFix' malware tricks users with fake error fixes

In the ever-evolving landscape of cybersecurity threats, hackers continually come up with new and sophisticated methods to deceive users. The latest scheme, involving a malware named ClickFix, highlights just how sneaky they can be. By preying on users' desire for quick solutions to common issues in widely-used services like Chrome, OneDrive, and Microsoft, these cybercriminals have crafted a trap that's as enticing as it is dangerous.
