

Talk to your future self with AI

Massachusetts Institute of Technology (MIT) researchers have created an AI chatbot that lets you talk with your “future self,” reports Euronews. Researchers utilised OpenAI’s popular GPT-3.5 model and asked study participants a series of questions about their lives, their past experiences, and their aspirations. The system subsequently generated what the study authors referred to as “a synthetic memory” or “a backstory of the user”.

You can now create AI avatars using just phone or webcam

Artificial intelligence startup Synthesia has unveiled several new product updates including a feature that allows users to create Apple-

style key presentations with AI avatars using only a laptop webcam or a phone. One of the most significant new features the firm showcased is the ability to create AI-generated avatars by recording less than five minutes of footage, reports CNBC. <https://bit.ly/3VzhUvm>

Meta now brings AI chatbot to WhatsApp, Facebook users in India

Meta AI’s launch was halted in India owing to the recently concluded Lok Sabha elections

—By **Mustafa Khan**

Meta has rolled out its AI chatbot Meta AI for the Indian masses now. Earlier it was limited to a few users in India, but now the AI chatbot is available throughout the country. Meta AI is not limited to any one particular app and is available across Meta Apps such as WhatsApp, Facebook, Instagram, and Messenger, as well as a dedicated website at Meta.ai.

It was previously available in countries such as Australia, Canada, and New Zealand. The delay in the Indian launch had its own particular reason. Actually, Meta AI’s launch was halted in India owing to the recently concluded Lok Sabha elections. We were among the few people with early access to Meta AI. What we liked most about Meta AI was the fact that it is built within our most used social media apps. You can access real-time information from Google and Microsoft without even the need

to leave your favourite social media app. Further, you can even directly access it within different chats and even group chats.

You simply have to type @MetaAI and type in your request. Not going to lie, it does feel a little creepy but Meta ensures us that Meta AI only reads messages where it has been tagged.

You can use Meta AI for writing emails, creating poems, summarising and translating text. Not just this, you

can even generate images directly within your social media apps with the help of Meta AI.

Well, some users have reported that they are still not able to see the Meta AI option in their apps, despite the announcement.

Meta is currently in the process of rolling the feature out and it will make it to your smartphones within a couple of days.
