

Colorful EVOL P15

Punching above its weight class

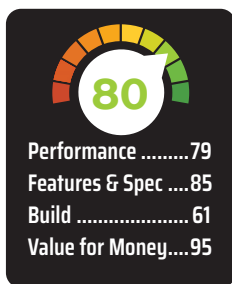

The Colorful EVOL P15 is a budget gaming laptop that features an NVIDIA RTX 4060 for under Rs 90,000! Rs 84,999 to be exact. The laptop actually launched at Rs 79,999, which for a laptop featuring an RTX 4060 is pretty crazy. You would be hard-pressed to find an RTX 4060 laptop under the Rs 1 lakh price point. While Colorful is a new brand in the laptop space, they've been around for a while.

They were primarily known for their GPUs, but have in recent years expanded to laptops. The Colorful EVOL P15 is their first gaming laptop offering to make its way to India. Having an RTX 4060 at this price seems too good to be true, so naturally, we had to test and find out if the EVOL P15 is just good on paper, or whether it actually packs a punch. Read the complete review to find out!

BUILD AND DESIGN

Colorful describes the EVOL P15's aesthetic as "Retro Futuristic". Now that might not make much sense when you read it, but if you look at the laptop, then you'll see why it's a pretty apt description. The review unit we received came in teal blue colour, however, there are grey and white colour variants as well. Compared to the grey and white variants, the blue colour definitely stands out a lot more. The lid features an angular print near the bottom which frames the Colorful logo, along with a reflective strip in the centre of the lid. The rear of the laptop and the grills under the laptop feature an angular design to "complete" the gaming laptop look.

₹79,999

Speaking of the build, you've got a fully polycarbonate body. The laptop doesn't feel particularly robust; understandably, sacrifices needed to be made somewhere to keep costs in check. We wouldn't say it feels too flimsy or unsturdy

though, definitely worth the price if you consider what it's packing inside.

Coming to the keyboard, you get a full-sized RGB backlit keyboard. The chiclet keys have good travel distance and decent feedback for an overall pleasant experience while typing and gaming. The lighting on the keyboard is adjustable via keyboard shortcuts.

Additionally, the laptop comes with expandable RAM and an extra NVMe slot which is always nice.

I/O PORTS

The laptop has a decent number of I/O port options. You have a total of three USB Type-A ports. Of these, two are USB 3 and one is USB 2. You also have a single Type-C USB 3 port with PD. Other than that, you have an audio combo jack, an HDMI 2.1 port, an Ethernet port, a miniDP port and the DC in port for charging. Decent coverage

for any additional peripherals you might want to plug into the laptop. The additional display ports are a plus.

DISPLAY

This took us by surprise, especially when the laptop was still under the Rs. 80000 price mark. The Colorful EVOL P15 comes with a 15.6-inch QHD+ IPS Panel, with a refresh rate of 165 Hz. If that wasn't impressive enough, we tested nearly 100 percent sRGB and DCI-P3 colour gamut coverage, at 99.8 and 99 percent respectively. That's pretty bonkers, especially at this price range. The display was also fairly bright, with a maximum tested peak brightness of 324 nits. Thanks to the RTX

4060 onboard, you can comfortably game at QHD+, and this also means that this laptop is an excellent choice for demanding creative workloads. On a budget!

PERFORMANCE

Finally, we're at the performance. I'm sure everyone is eager to know if this laptop actually performs like it has an RTX 4060 onboard. Well, I'm happy to report that it actually does. Let's revisit the specs real quick. You've got a 12th gen Intel Core i7-12650H, paired with an NVIDIA RTX 4060 Laptop GPU with a TGP of 140 W.

The 12th gen i7 is a fairly popular processor in gaming laptops north of the 90K mark. It has 10 cores (6 performance + 4 efficiency cores) and 16 threads, with a max clock speed of 4.7 Ghz. It's more than capable of handling AAA games and intensive workloads. Paired with the RTX 4060, the Colorful EVOL P15 not only easily competes with, but surpasses laptops that cost over a lakh in terms of gaming performance. Let's get to the numbers!

Starting off with basic productivity and processor benchmarks. We use Geekbench 6, Cinebench R23 and PCMark 10 to general productivity and processor performance.

Like we mentioned above, the numbers are solid, you are definitely getting
