

# Acer Swift Go 14 AI

Impressive performance and display at an affordable price

₹84,990

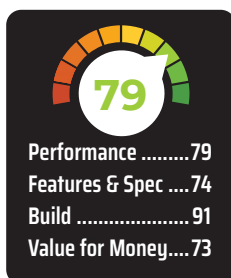

**T**he Swift lineup of laptops from Acer has always

been a staple in the mainstream and thin & light laptop market. The Acer Swift Go 14 AI is the latest iteration of the Acer Swift 14 and promises improved performance and value for money over its predecessors with the new Intel Core Ultra processor inside supported by Arc integrated graphics. Does it live up to its promise? Read on to find out!

## PERFORMANCE

Let's dive into the performance right away. This model of the Acer Swift Go 14 AI we're reviewing comes equipped with the Intel Core Ultra 5 125H, and is priced at Rs 84,999 as of writing this review. You also have Intel Core Ultra 7 variants and different display configurations as well, which you can

check out depending on your budget.

Coming back to the performance. This time around graphics are powered by the integrated Intel Arc GPU. We have to say, there definitely is a visible leap in performance compared to last year's

integrated Intel Iris graphics. Take a look at the 3DMark scores for yourself.

Those are pretty solid numbers across the board, especially for an integrated graphics card. Meaning the laptop can easily allow for some light gaming; older titles and less graphic intensive titles should have no trouble running on this laptop.

With that we come to the processor and productivity benchmarks. For this we use PCMark 10, Cinebench R23 and Geekbench 6.

Once again, we've got some pretty solid numbers across the board. The

Intel Core Ultra 5 125H comes with 14 cores and 16 threads and easily manages to compete with other sub-1 lakh mainstream laptops. The integrated Arc GPU also pulls its weight, offering competitive performance comparable to an RTX 2050.

Other than that, the Acer Swift Go 14 AI comes with 16 GB of speedy LPDDR5X RAM and a decently fast NVMe SSD as well.

Putting everything together, what we have here so far is a pretty solid overall package. But we're yet to get the display.

## DISPLAY

The Acer Swift Go 14 AI comes with a fantastic 14-inch WQXGA+(2880 x 1800p) resolution OLED display. The colours pop and the visuals look crisp and vivid. Blacks are fantastic thanks to the OLED display. We tested a peak brightness of 391 nits, which is very close to the advertised peak brightness of 400 nits.

We also tested 100 percent sRGB colour gamut coverage and 99.8 percent DCI-P3 colour gamut coverage. Again, both excellent scores. Combined with the performance scores above, this makes the Acer Swift Go 14 AI an excellent candidate for creative workloads as well; for your editing, and even light rendering needs thanks to the impressive integrated GPU performance.

## BUILD AND DESIGN

The new Acer Swift Go 14 features an angular aluminium body. The laptop itself is very slim at around 15 mm, and at slightly under 1.4 kg, it also barely makes it into our thin and light laptop category. Either way, the laptop is very convenient to carry around.

The pure silver colour featured on the Acer Swift Go 14 is a fairly generic aesthetic, which is fine. It's not trying to stand out or draw attention. It's also fairly sturdy, and didn't flex or bend much around the corners or even the keyboard area. The lid can be opened with one hand, which is always appreciated. The lid props the back end of
