

should be blazing through your tasks with ease.

DISPLAY

The Display on the Latitude 7350 is decent. It could have been better in our opinion, especially for the premium that you're paying for the laptop. We measured a peak average brightness of 375 nits, which is good. We tested 94.9 percent sRGB and 71.9 percent DCI-P3 colour gamut coverage, which in our opinion could have been better.

BATTERY

The Latitude 7350 features excellent

battery life. At 100 percent brightness, the laptop lasted 14 hours and 29 minutes during the PCMark battery test, and close to 3 hours in the PCMark 10 gaming battery test. You will have absolutely no trouble getting through an entire day without needing to charge this laptop making it fantastic for working professionals on the go who don't have access to charging 24x7.

THERMALS

Coming to thermals. Peak surface temperatures at 100 percent CPU load hit around the 43-44 degrees Celsius mark, especially around the WASD cluster

and the top centre of the keyboard. The highest CPU core temp we saw was 100 degrees Celsius, while the average was around 77 degrees Celsius. That said, there aren't many occasions where you will actually hit 100 percent load, but the laptop can get toasty enough to not want to keep it on your lap.

SOFTWARE: DELL OPTIMIZER

The accompanying software, Dell Optimizer, allows you to tweak the way your machine works. It allows for several degrees of customisation. One of the more interesting features you can access through Dell Optimizer is Presence Detection, which can detect onlookers and hide your display. It can also detect your presence, unlock when you approach and lock the laptop when you leave.

VERDICT

The Dell Latitude has a lot going for it. It features a premium and robust ultralight build. Decent I/O port selection (including 2 Thunderbolt 4 ports), fantastic battery life, and some neat new features like the collaboration touchpad. While the number of AI tasks is limited for now, the presence of an NPU offers some degree of futureproofing. Of course, compact laptops like this always have heating issues when under load so that's worth keeping in mind. Additionally, we would have liked a better display. Overall, we would still say that the Dell Latitude 7350 Ultralight is a fantastic laptop for business professionals looking for an AI enabled ultralight laptop on the go.

—Manish Rajesh
