

realme Buds T110

Solid in-ear earphones for the price

realme has been slowly making its holding strong in the highly competitive budget TWS in-ear earphones space.

Their latest offering, the realme Buds T110, showed up at the Digit Test Centre back in April, and after sharing my first thoughts about these in-ear earphones on X, I tested these in-ear earphones to see their performance in the long term. And, I must say, these in-ear earphones did not disappoint, especially considering the price at which they launched.

realme Buds T110 launched in India for Rs 1,299, and for that price, all you need in a pair of TWS (considering where the other offerings lie) is a serviceable sound signature, mic quality and reliable connectivity packed into a solid package. These in-ear earphones bring exactly that to the table. Pitted against offerings from brands like Noise and boAt, two of the biggest manufacturers in this price range, these in-ear earphones ensure that you not only get what you would expect but more! Let's find out how these in-ear earphones fared when I put them through our rigorous testing process –

BUILD AND DESIGN

realme Buds T110 come with a robust case that has a matte finish and a dual-tone design on the Blue and Black variants. We got the Blue variant at the Digit Test Centre, and the case looked great at the price. In contrast, the buds sport a dual-texture finish, with the lobe sporting a glossy finish and the stem having a matte finish complementing the case. Both the case and the buds are made of robust plastic, which would hold well in long-term use.

The fit, which is a completely subjective thing, was great for me. As I say,

₹1,299

with audio, it is the best practice to try the product out for its fit and sound before you try it. We try our best to communicate our findings about the fit, but at the end of the day, it will be your preference that will make or break your leaning towards these in-ear

earphones. The sound signature of the buds is also affected by the fit you get, which makes it all the more important to ensure that you have a great fit. Coming to the case, it is pocketable and the rounded design ensures that you do not have any difficulty when you are pulling it out of your pocket.

The branding on the case is subtle, and does not look tacky at all. The lid, although lacking a metal hinge, is strong and the magnets holding the lid and the buds are strong, not letting the buds fall out of the case or the case lid open accidentally. All in all, solid case made by realme in the build and design department.

FEATURES

There is nothing to write home about in terms of the features of the realme Buds T110. These in-ear earphones, as

one would expect for the price, come with a limited set of features, but whatever features there are in these in-ear earphones, they are very well implemented. First off, we get the low latency mode, which is a boon for gamers on a budget. It claims to bring down the latency of the in-ear earphones to 88ms. In my experience, this mode, while consuming relatively more battery, was worth turning on. There was a noticeable difference for me, and in terms of the numbers, it was a big drop from the 200-600ms latency when in normal mode.

Note: The low latency mode only works with Android devices.

We also get ENC in these in-ear earphones, which claims to improve the microphone performance by cutting down on the background noise that is picked up, using AI. I will talk about the efficacy of this in the performance but for now, to give you a sneak peak, it does its job well. Then you have Google Fast Pair, which also worked as expected. Then there is the realme Link App, which we have covered in detail in our other reviews. It is one of the most polished apps in the industry right now, and gives you enough room to tinker with the buds.

No gripes here at all. As I said earlier, solid and well implemented features all around, especially considering the price.

PERFORMANCE

Coming to the performance of the realme Buds T110, let's start by talking about the sound signature of the buds. As you can see in the sound signature graph below, the bass is boosted, which is expected in in-ear earphones at this price. And, as it would be, with this much of a boost, it rolls into the mids and the highs, which in scenarios where dialogue is mixed with heavy background tracks, muffles them. If you are listening to tracks like Rescue Me by OneRepublic, then you will definitely notice the overwhelming bass eating into the vocals.

However, if you are someone who is a basshead, or fan of genres like Bol-
