Head of Digital Imaging,
Sony India

Sony bets big on Global Shutter tech for mirrorless consumer cameras

In conversation with **Mr Mukesh Srivastava** of Sony India

Ali Akbar Merchant | ali@digit.in

In the wake of Sony's Alpha 9 III launch, we sat down with Mukesh Srivastava, Head of Digital Imaging Business, Sony India to get his insights about Sony's growth story in India and about what makes the Sony a9 III stand out among its peers.

Q So the headline feature for the Sony A9 III is the global shutter.

What prompted Sony to adopt this tech and bring it to this segment?

A The launch of Alpha 9III marks the beginning of a new era in professional photography with it being a game changer with just the central upgrade of global shutter image sensor, which makes it the fastest camera in the entire Alpha range. The camera is designed to allow its customers to take

advantage of the unmatched shooting speed. Featuring the world's first full-frame Global Shutter, this camera has shutter speed of 1/80000 second, 120fps with RAW, blackout free images and flash sync at any possible speed.

Shutter speed is free from the limitations of conventional mechanical shutter image sensors and achieves a maximum shutter speed of 1/80000 second (1/16000 second during continuous shooting), making it possible to capture at high speed without any distortion. The newly installed Pre-Capture function allows the customer to go back up to 1 second and record the moment before pressing the shutter, a Continuous Shooting Speed Boost change during shooting, and enhanced burst stamina ensures that important moments are reliably captured due to a large buffer memory and increased overall system speed allow up to approximately 390 Fine JPEG images to be captured in one continuous 30 fps burst.

The global shutter image sensor provides distortion-free image expression for videos as well as still images. For example, the customer can shoot images of nearby scenery from a fast-moving vehicle such as a car or fast-moving subjects with ease. This camera is the first in the Alpha series to be able to record 4K 120p high-frame-rate video without cropping, allowing the customer to shoot at the intended angle of view. It is also possible to shoot high-resolution 4K 60p videos with 6K oversampling.

With Alpha 9 III, Sony has taken cognizance of feedback from professional photographers and therefore created operability and reliability that supports professional image makers.

Q Will the global shutter tech trickle down to the APS-C line as well in the future? If yes, what would the timeline for that be?

A At Sony, we have always been at the forefront of technological innovation, aiming to provide creators with tools
