

Best AI Tools for Coding

Now, let's look at some of the best options that you must try.

Cursor AI

The Cursor AI coding editor acts as a collaborator, understanding the context of your project and offering assistance throughout the coding workflow. Its Copilot++ feature can suggest midline completion. You can also chat with AI that's monitoring your code and discuss before making changes. The basic Cursor AI version is free. The Pro version costs \$20 per month or \$16 per month when billed annually.

GitHub Copilot

One of the major advantages of GitHub Copilot is that it is integrated into the GitHub ecosystem.

While it supports various programming languages, its effectiveness varies. It particularly shines for small programs where there is not much context or for tasks that can be automated. GitHub Copilot is available for free to certain developers, provided they share their code with Microsoft for training the model. Subscriptions for team users cost \$4 per month.

Codeium

Codeium AI offers precise code suggestions, code explanations, and automated test generation,

all aimed at refining code quality and clarity. It offers specific tips to improve your code, explaining code in simple terms, and even making tests automatically to check your code. It's great for working together with others too. Codeium is free for individual users. Teams can opt for a paid subscription for \$12 per month.

Amazon CodeWhisperer

Amazon CodeWhisperer looks at what you're typing and suggests how to finish it based on what you've written before. It works best with certain programming languages like Java and Python. You can use it in programs like Visual Studio Code and with Amazon's cloud services. Amazon CodeWhisperer is free for individuals and affordable for businesses. To get it, you just need to add it to your program, connect it to Amazon, and sign in.

Tabnine

Tabnine is a coding tool that can also create bespoke models trained on your codebase to stick

to your coding style. Users can set their guidelines for static code analysis. They can also share and import code snippets with others within their own IDE. You can use Tabnine for free with basic features for 90 days. The Pro version costs \$12 a month.

AskCodi

AskCodi is a versatile tool that can directly access its features within popular IDEs like VS Code

and PyCharm. The premium version lets you switch between different AI models. The Basic free plan includes 50 credits per month. The Premium plan costs \$9.99 per month and gives you 500 credits per month. The Ultimate plan costs \$29.99 per month and awards 3000 credits per month.

Mutable AI

MutableAI's AI Autocomplete feature suggests helpful bits of code as you type to make your job

simpler. MutableAI not only helps you write code but also has a Production Quality Code feature that helps you tidy up your code, making it work better. You can chat with it and tell it what changes you want to make with the Prompt-driven Development tool. It even helps out with Test Generation. And it works with multiple languages and popular IDEs. The basic plan starts at \$2 a month per project, or you can go for the premium plan at \$15 a month per project for some extra perks.

Replit

Replit serves as a dynamic Integrated Development Environment (IDE) powered by AI. You can

simply hover over an identifier or function and a little window pops up with the type and some information from the documents. Its real-time collaboration feature fosters seamless teamwork. Its version control system helps with effortless tracking and restoration of code. You can also access Replit via mobile and tablet apps to code on mobile devices. You can start with a free version and the Core plan costs \$20 per month and \$10 per month when billed annually.
