Google expands 'Dark Web Reports' to all users

Last year, search engine giant Google introduced a safety feature known as "Dark Web Reports". This feature allowed its Google One subscribers to check if their personal data is available on the dark web or if it has been breached. Now, Google has further increased the reach of the feature to other non-subscribers too. As

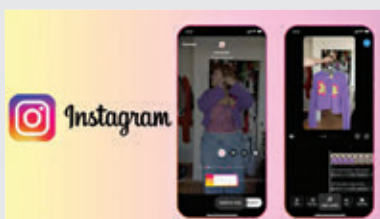

we mentioned before, users will now be able to check for themselves if their data is being used on the dark web. As per an updated banner on the Google One app, the feature will not be exclusive to users after "late July". Further, if you click on the 'Learn More' button on the banner, it leads to Google's support page.

Instagram now lets you add multiple audio tracks to a single Reel on their platform

Now, you can add not just one, but multiple audio tracks to a single Insta Reel, opening up a whole new world of creativity. Whether you're crafting a lip-sync masterpiece, showcasing your dance moves to different beats, or telling a story through music, this feature gives you the flexibility to mix and match audio tracks seamlessly. This enhancement promises to amplify the entertainment factor of your Reels, making them even more engaging and dynamic for your audience. In an Instagram post, the company announced that you can now add up to 20 tracks to a single Reel and visually align audio with elements like text, stickers, and clips. <https://bit.ly/MultiInsta1>

Google and Microsoft consumed more energy than 100 countries combined in 2023

In a recent report by analyst Michael Thomas, which he shared on X (formerly Twitter), both of these companies used as much energy as much as used by Azerbaijan which has a GDP of \$78.7 billion. If you are still not able to understand how huge this number is, countries such as Iceland, Ghana, the Dominican Republic, and Tunisia each consumed 19 TWh, while Jordan used 20 TWh of energy.
