

Samsung Galaxy Z Fold6

Bends like the best

At a massive Unpacked event in Paris, Samsung finally took the wraps off of the Galaxy Z Fold6 and the Samsung Galaxy Z Flip6. Last year, OnePlus gave us a very complete and refined OnePlus Open, and then came the Vivo X Fold3 Pro more recently, which further proved the point, along with offering a much slimmer and sleek device. So can the Samsung Galaxy Z Fold6 remain the king of foldable devices in this battle of the GOATS?

DESIGN

The Samsung Galaxy Z Fold6 has a familiar form factor with slight tweaks here and there. This year, we are getting a 1mm wider cover display, which does make things better, but still doesn't make the cover display wide enough to be used as a proper glass-slab smartphone. We are also getting a more squared-off form factor this year. The frames are completely flat, and the front and back are also absolutely flat on the Samsung Galaxy Z Fold6. The sharp corners, make the palm grip of the Samsung Galaxy Z Fold6 a little uncomfortable. But that's just a nitpick. The design of the Samsung Galaxy Z Fold6 is very clean and seamless. Even the materials used in the smartphone's build just feel very premium from the moment you hold this smartphone. This year the camera cutouts are now bigger with thicker borders and the camera rings are now black in colour. The orientation, however, remains the same with the three cameras placed vertically. Now, talking about the weight and durability, here also the Samsung Galaxy Z Fold6 checks all the boxes. Even the weight of the smartphone has been reduced significantly.

₹1,64,999

ask for in a smartphone along with the first certified dust protection. And best of all, my favourite design element remains, which is the under display front camera on the main display.

DISPLAY

Coming to the display, during a normal sunny day in Delhi, the Samsung Galaxy Z Fold6's cover display is able to push out a typical maximum brightness of over 1200 nits, which is brilliant. Apart from being bright, this outer display is also very accurate in terms of how it represents the colours. I ran the Calman Colorchecker on

the outer display of the Samsung Galaxy Z Fold6 and here, this display showcased an average DeltaE of 0.9, which basically means that the colours you see with your eyes and the colours you see on the Samsung Galaxy Z Fold6 cover display can not be differentiated by the human eye. A DeltaE of less than 3 is considered good for smartphones.

Coming to the main display, here also, the smartphone pushed its peak luminance to 1319 nits and represents colours very accurately. The 7.6-inch foldable panel showcased equally good colour accuracy, achieving a DeltaE of 1, which is almost as good as real-world colours and very close to the quality that we're getting with the cover display. Yes, it is tuned more towards the vibrant or saturated side of things. And yes, the crease is dense. But let me make sense of both these things. Firstly, the display tuning, despite making the colours appear vibrant, is still extremely accurate. Talking about the crease, I'm pretty sure that the crease on foldables is not going away anytime soon.

PERFORMANCE

Performance of the Samsung Galaxy Z Fold6 is also as good as it gets. Looking at the specs, it is no surprise that the Samsung Galaxy Z Fold6 absolutely smashed the benchmark tests. The smartphone achieved a score of above 1.5 million on AnTuTu and in other CPU-based benchmarks also, the smartphone offered great results. However, it does fall short in AnTuTu as compared to the fiercest rival, the Vivo X Fold3 Pro. In rest of the benchmarks, the Samsung Galaxy Z Fold6 was able to trump the X Fold3 Pro, even though the difference was marginal. The Samsung Galaxy Z Fold6, however, heats up. However, if I remember from last year's experience, the heating isn't as bad as the previous generations. In the CPU throttling test, the Samsung Galaxy Z Fold6 throttled to 69 percent of its peak performance.

Even playing games on the Galaxy Z Fold6 is a beautiful experience. Currently, all games are not tuned according to the bigger display, but you shouldn't have any issues with some of the major titles
