

Turning the screen on an off takes a few attempts to get used to. But once you have your hands set, you will rarely encounter major operational hitches. The EQ on these earbuds, which can be controlled from the screen itself, is also pretty neat and adds a layer of customisation awesome sauce on these otherwise bland pair of TWS in-ear earbuds.

PERFORMANCE

If you thought that me drawing parallels between the U&I TWS-9009 and the Apple AirPods would continue into performance, then you couldn't be further from the truth. All the brownie points gained by the U&I TWS-9009 are consumed by these TWS in-ear earphones when it comes to performance. As you can see in the sound signature graph on Digit.in, these TWS in-ear earphones have a massive dip in the mids, which translates to the vocals being subdued.

This means that if you are a fan of bands like OneRepublic, whose songs are mastered to focus on the vocals, your experience might not be the best. Same is the case with podcasts that might have a slightly louder backing track. The bass and the highs might eat into the vocal range. However, if you are someone who does not want the most crisp sound, and are looking for a decent daily listening experience, then you are in luck. While not the best, these TWS

in-ear earphones are serviceable for genres like Bollywood, Hip-Hop, and Pop, where the bass frequencies take the centre stage.

As for the mic, the sound is muffled and boomy, which brings down the overall quality of the calls that you would take. One of the biggest surprises for me was that these TWS in-ear earphones handled the background noise quite well. However, the suppression of background noise, took a toll on the overall quality of the test recording that I took on them. Here's a sample that I recorded in office with a lot of background chatter going on –

Coming to the ANC, it is nothing to write home about. The great fit definitely helps the cause, but you would not be looking at flagship level ANC performance for these earbuds. I would say that the ANC is a good fit for anyone looking to step into the world of exploring ANC tech, and this would be their first ANC TWS in-ear earphones.

BATTERY LIFE

The battery life of the U&I TWS-9009 as claimed by the band on the packaging, was 100 hours. In my test, with ANC on and volume set to 50 per cent, these earbuds lasted for four hours and 45 minutes, which is not terrible, but could use some extra power up. The included USB-C cable can be used to charge these

TWS in-ear earphones when you run out of juice.

VERDICT

There is no audio product that I have experienced while testing audio products that I could compare against these earbuds. The screen makes for the biggest focal point of the U&I TWS-9009. I would not pick these earbuds as the best performers in this price range. The only reason why I would recommend you get your hands on these earbuds would be to try out the new trendy screen on the case and see for yourself how a screen integrated into the pair of TWS in-ear earphones would affect the overall user experience. If you are looking for a pair of great-sounding TWS in-ear earbuds around the price of the U&I TWS-9009, then I would recommend the Realme Buds Air 3 and the CMF Buds Pro 2.
