

realme Buds Air6 Pro

A worthy competitor of the Oppo Enco Air3 Pro

realme Buds Air6 Pro, competing with the likes of the Oppo Enco Air3 Pro in the mid-range TWS in-ear earphones market, hit the ground running on a great note! As I noted in my first impressions article that I penned after spending 24 hours with these in-ear earphones, they are a solid offering for ₹4,999. I was sceptical about their performance in the long run, but once I was done testing these in-ear earphones, all my doubts went away. Read along to find out how the realme Buds Air6 Pro fared in my testing –

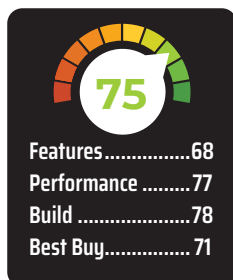

BUILD AND DESIGN

The design of the realme Buds Air6 Pro is polarising. The case has a glossy, chromatic finish, which looks awesome to some, and for others, it is a turn-off. I passed around these TWS in-ear earphones at the Digit Test Centre, and the thoughts echoed by the team seconded my observation. Another thing that would put these in-ear earphones on the fringes of many buyers' radar is the fact that the body of the case is very prone to scratches and is a definite fingerprint magnet. So, take the call for yourself.

The overall build of the case and the buds is strong, and the case has a nice heft to it. There is no metallic hinge, which is something that I personally crave, but the plastic hinge holds up well in day-to-day use. They build on to the expectations set by their predecessors, the realme Buds Air5 Pro. The fit of the buds also stays closely in line with that of the Buds Air5 Pro and makes them fit well in for a variety of people. The buds hold their own when you are working out and the case, thanks to its

rounded design, is fairly pocketable too.

FEATURES

In terms of features, the realme Buds Air6 Pro leaves no stone unturned. These earbuds come with all the customisation that you could ask for, thanks to the

realme Link app. I would like to borrow a line from my first impressions article of these in-ear earphones – “The UI of the app is clean, polished, and intuitive. One of the standout things is the Golden Sound Test, which is the name given by realme, to their personalised tuning feature. When I did the test, it made the sound brighter for me, with better imaging of instruments. Definitely a win there.”

Apart from that, you have the mind-flow feature, which helps in meditation and mindfulness activities with its great selection of peaceful melodies that you can access from within the app. The best part of the app is the custom EQ that you can use to tune the buds to your liking. As I mentioned

in every audio review of mine – Everything related to audio is subjective. This stands true for the design, features, and, most importantly, the sound signature of the product. So, having an EQ is a great addition to any audio product.

You can customise the controls from within the app, do the very useful ear-tip fit test, and use realme's own version of custom audio analysis, the Golden sound test. In my case, the Golden sound test and the ear tip fit test worked together to tune the audio, bringing out the best of these earbuds for me. Do not forget to give it a try along with the others that are baked into these earbuds.

My biggest gripe with the app, as I mentioned in my earlier coverage of the realme Buds Air6 Pro, is the fact that the app does not allow you to access any of the features without signing in. In this era of tech, where privacy and data security remain something that is very important for us, it is a big turn-off. Other TWS companion apps tend to limit the functionality of their app without sign-in. However, basic customisation and controls are still available for people. However, this is not the case with the realme Link App. I would like to request that the brand opens the gates to some features in the app so that folks who do not want to share their data or log in to the app can use it.

PERFORMANCE

Coming to the performance of the realme Buds Air6 Pro. This was the area where I held my judgement until I used these in-ear earphones for a longer period of time. And they did not disappoint me. The earbuds pack an ample amount of performance for the purists as well. But you will need to tune them to ensure that you get the best of them. These earbuds pack a dual driver setup – 11mm bass driver, and a 6mm micro-planar tweeter. With a dual-driver setup, it is important for the brand to tune the drivers properly so that either of the drivers does not mask the other's audio.

As you can see in the graph on Digit.in, the sound signature of the realme
