

Meet MyFi

An AI-based personal finance app powered by LLM for wealth generation

Jayesh Shinde | jayesh@digit.in

Imagine a personal finance management app that you only interact through an AI-powered chatbot and you wouldn't be too far off the mark from MyFi. In a world where investment apps have traditionally doubled as trading platforms, allowing users to buy and sell stocks with a few taps on their smartphones, MyFi, a new entrant backed by TIFIN, is charting a different course, according to its co-founder and CEO.

"MyFi leverages a combination of AI models to deliver personalised investment recommendations. In essence, MyFi leverages AI to provide a transparent, accountable, and unbiased investment experience by combining human financial expertise and leveraging AI, to prioritise financial success of our users and adapting to their

evolving needs," said Kiran Nambiar, Co-founder and CEO of MyFi.

MyFi claims to be India's first conversational AI assistant dedicated to long-term wealth creation. Unlike most other investment apps that charge trading fees from users, MyFi's incentive is to only front personalised investment advice through high-quality research through an AI-powered chatbot, all for a monthly subscription fee of ₹299.

"Think of the app as an assistant who not only gives you options based on market realities but does so in the context of your current investment portfolio, all in conversational form and in a simplified language you can understand," according to Kiran Nambiar.

MyFi is registered with SEBI as a Registered Investment Advisor (RIA) and is operating in strict accordance

with all relevant government regulations, emphasised Nambiar. The fundamental user problem it's trying to solve revolves around mutual funds.

You don't need me to tell you how millions of Indian investors are actively investing in mutual fund schemes, thanks to a big role played by SIPs (Systematic Investment Plans). Not just exciting opportunities, there's severe complexities and cautionary tales to curb your reckless enthusiasm in this space – just look at all the legal disclaimers of every MutualFundsSahiHai.com advert on TV! Nambiar believes this segment can't be adequately addressed only through human interaction given the sheer volume of investors, making it ideal for customised and personalised investment advice that only AI-powered systems can provide. This is where MyFi enters the financial landscape hoping to disrupt the space with AI and guide individual investors to navigate their long-term financial goals.

While he didn't reveal the exact foundational model(s) powering MyFi's chatbot layer, Kiran Nambiar did explain what happens behind the scenes. At the core, the LLM provides a chat experience that goes on to understand user questions. This user understanding is then passed to sophisticated financial models which are based on deterministic values. "These financial models have been built and back tested over years by our team of seasoned investment professionals, considering market data, historical trends and various factors. The information is then fed back to the LLM to generate personalised responses with the recommendations from our models that's tailored to the user," he explained.

It's interesting that MyFi is wholly AI-powered, free from human bias at the customer interface level, according to their claims. But what about AI bias and hallucination impacting their investment advice?

MyFi prioritises unbiased and fair recommendations through a combination of data transparency and human
