

It's story time!

W

hat do you do when there is not much to report from the Test Centre apart from

Satvik visiting the Mumbai office, getting all emotional after getting his hands on parts of his PC, and coming back to Noida, hopeful to continue gaming again? Or after mentioning that the SKOAR! Council hasn't gamed a lot. Not anywhere close to what they did?

Well, you write a story. Read on -

Once upon a time in the bustling city of Techville, there lived a tech nerd named Mads PJM. Mads was known for his insatiable curiosity about all things tech. His room was a shrine to silicon chips, motherboards, and RGB lighting. One fateful Saturday, Mads decided to venture into the labyrinthine corridors of the local computer hardware mall, a place whispered about in hushed tones among the tech community.

As Mads entered the mall, he was greeted by a cacophony of beeps, whirs, and the occasional spark of static electricity. The air was thick with the scent of new plastic and solder. Mads' eyes gleamed with excitement as he navigated through aisles filled with the latest GPUs, CPUs, and other tantalizing components. However, Mads' journey took an unexpected turn when he stumbled upon a dimly lit corner of the mall, a place he had never seen before. The sign above read "Bargain Bin Bonanza." Intrigued, Mads ventured inside, where he was greeted by an

eccentric old man with a wild beard and a mischievous glint in his eye.

"Looking for a deal, are we?" the old man cackled. "I've got just the thing for you, a gaming PC like no other!"

Mads' heart raced as the old man unveiled a dusty, cobweb-covered tower. It was a Frankenstein's monster of mismatched parts: an ancient Pentium III processor, a GPU that looked like it

Mads spent hours trying to optimize the system, tweaking BIOS settings, and installing drivers from obscure websites. Finally, he managed to get it running well enough to launch his favorite game, "CyberQuest 2077." The game stuttered and lagged, but Mads was determined to make it work.

Just as he was about to embark on his virtual adventure, dark clouds gathered outside. The sky rumbled ominously, and a torrential downpour began. Mads' room was suddenly illuminated by a flash of lightning, followed by a deafening crack of thunder. The power surged, and the ancient PC let out a pitiful whine before emitting a puff of smoke.

Mads watched in horror as his prized (albeit terrible) gaming rig sparked and fizzled. The rain gods had spoken, and they were not pleased. The PC was beyond repair, a smoldering heap of fried circuits and melted plastic.

Defeated but not disheartened, Mads vowed to learn from his experience. He returned to the hardware mall, this time with a more discerning eye and a determination to build a gaming PC worthy of his passion. And so, armed with newfound wisdom and a healthy dose of skepticism, Mads set out on a new adventure, ready to conquer the digital realms once more.

And thus, the legend of Mads PJM and the worst gaming PC of all time became a cautionary tale among the tech community, a reminder that sometimes, the best deals are the ones you don't take. 

"No."

- Manish this entire month

had survived the Y2K bug, and a power supply unit that hummed ominously. The case was adorned with stickers from defunct tech companies and a single, flickering RGB strip.

Despite the red flags, Mads' curiosity got the better of him. He handed over a modest sum of money and lugged the monstrosity back to his room. With a sense of anticipation, he plugged in the PC and pressed the power button. The machine roared to life with a cacophony of grinding fans and a BIOS screen that looked like it belonged in a museum.
