

Nerivio for Migraine Pain Management

Find out how good it is at its job!

Manish Rajesh | rajesh@digit.in

Before I get started with my experience using Nerivio, I should point out that this was a review unit received from Dr. Reddy's free of cost and this article is based on personal experience.

As someone who has experienced migraines for over a decade, Nerivio was a device that seemed too good to be true. This was a non-pharmaceutical

approach to managing migraines, so no tablets or pills or any such thing. The device could supposedly provide relief through innovative wearable technology. Specifically, neuromodulation.

Let's start off with the first impressions of the device itself. The device is quite compact and the instructions to use it are simple. There's two components to the device, the band, which somewhat resembles a large wristband, and the Nerivio device itself. The Nerivio is slotted into the band and then wraps comfortably around the upper arm. Nerivio itself has an adhesive to keep it stable on the skin, and the wristband is secured with velcro. The adhesive isn't too strong or too weak and can be maintained easily as well. Setup was straightforward; after downloading the companion app, I followed simple instructions to pair

it with my smartphone via Bluetooth. The app itself is intuitive, offering clear guidance on how to use the device and track sessions.

Once activated through the app, Nerivio emits subtle electrical pulses, a form of remote electrical neuromodulation. The sensation is gentle, akin to a tingling or buzzing feeling, which initially took a moment to get used to but was not uncomfortable. You can control the strength of the current and are advised to keep it only as high as comfortable and not over. These electric pulses supposedly compete with pain signals traveling to the brain, with the result being a reduction in the perception of migraine pain.

When I first used the device during a migraine after following all the above instructions, I was somewhat surprised to see that my pain was indeed gradually diminishing over the 45 minute course. It wasn't a magic instant treatment for the pain, but it did definitely feel like the pain was being managed in some way.

Nerivio also advertises itself as a preventative measure for migraines. Repeated sessions at regular intervals can supposedly lessen the frequency of migraines entirely. While I cannot confirm if this is the case, I can personally say that using the device during the onset of migraines did seem to prevent it from escalating into a full-blown episode. The frequency of migraines vary on a case to case basis. In my case, I used 12 sessions with the device over a span of 3 months. That said, like any treatment, Nerivio isn't flawless. There were times when the effectiveness varied, particularly during more severe migraine attacks. In most cases, I found the most effective treatment was to supplement my usual migraine painkiller with Nerivio.

Nerivio does have some things going for it. The non-invasive approach, lack of side-effects, and portability make it convenient for use at home or on the go. While it may not completely eliminate migraines for everyone, it does provide relief and potentially reduce migraine frequency.
