

INDIA'S TECH MANUFACTURING LANDSCAPE

Past, present and future of Indian tech, with industry inputs

Satvik Pandey | satvik@digit.in

India has seen exponential growth in the personal technology sector over the last few years. Fuelled by the increased demand after the pandemic as institutions across the board adopt a hybrid approach to their functioning, majorly educational and professional institutions, India has reported unprecedented numbers in the personal technology space. As reported by Statista Market Insights, the consumer electronics market in India has reported growing revenue year on year since 2020, growing from 58.9 billion USD in 2020 to 85.4 billion USD by 2023. "The market is projected to grow annually by 5.93%, representing a compound annual growth rate (CAGR) for the period of 2024-2029," as reported by Statista as a part of their Market Insights report about consumer electronics in India.

This increased demand has also led a lot of Indian companies to become active in the Indian market and overseas companies to invest in the consumer electronics manufacturing sector. This growth of the Indian electronics manufacturing sector is thanks to the increased outsourcing of manufacturing by OEMs from across the globe.

Samsung set the ball rolling back in 2018, as they inaugurated the world's largest mobile factory in India. Since then, Apple has followed suit, and there are brands across the spectrum flocking to India.

Multiple brands, including Indian manufacturers, have made the push ever since to add to the growth of India's consumer electronics manufacturing landscape. We have seen the rise of brands like boAt, Boulton, Mivi, and the like, who have ensured that their Made in India products have hit the shelves and are providing Indian consumers with value-for-money tech that is made in their own backyard.

GOVERNING AUTHORITIES TAKE CHARGE

Governments, both at the state and central level, have ensured that brands looking to set up their manufacturing bases in India are greeted with a friendly environment, be it in terms of infrastructure or monetary and developmental support from the Indian government's institutions. Back in 2015, we had done a cover story in the magazine titled "Make in India, Make Money". There, our editorial team had

pointed out several factors behind the Make in India push and how making consumer electronics in India was

more viable than ever for Indian and overseas companies alike. You can have a look at that issue of Digit Magazine here - <https://bit.ly/DGTAug2015>

Ever since, the pillars of the Indian manufacturing sector have grown taller and stronger. Several reports and interactions with industry experts point towards the availability of brilliant minds with engineering acumen and support from the governments to be one of the biggest drivers of growth in this space. If you look at our reportage from Taiwan Expo 2024, you will notice that market leaders from there also hint towards the same.

GLOCALISATION FTW!

Given the scale of the Indian market and the potential it holds, brands across the board in the world of consumer electronics have flocked to make their products in India and for Indian consumers. We have seen brands like Sony tuning their audio products for the Indian market, with other manufacturers in the space, like LG, also
