

following suit. In the world of smart-phones, India-specific launches and SKUs are also more common than ever.

Startups that are collaborating with global players, the growth of 5G has empowered Indian innovators and consumers at all levels with information, and the improved research and development facilities the country, are some of the key motivating factors for global brands to set their foot in India, and are also promoting Indian minds to stay back and setup base in India.

Glocalisation is the fusion of Globalisation and Localisation, hinting towards the adaptation of otherwise global concepts and products to suit the needs of a localised market.

will contribute to India's steady rise towards the top of the manufacturing landscape. This will have a multi-fold effect for the consumers in India.

They will have access to the latest technology at considerably cheaper prices, launches will see an uptick and will be quicker, and there will be plenty of options to choose from. As a ripple effect of this, we will also see improvements

in the post-sale consumer support and repairs in the country, as components that would otherwise be sourced from abroad would be readily available from the manufacturers and can be harvested from older products as well.

One thing that we, as consumers, would need to be mindful of is the recycling of consumer electronics. There are plenty of examples from regions across the globe of how the increased manufacturing potential has led to uncontrolled generation of e-waste which has affected the locals. So, as we grow towards being the consumer electronics manufacturing hub of the world, let's be mindful of the e-waste that we generate and ensure that we are using our electronics in the most efficient way possible, and when the time comes, getting rid of it in the most environment friendly way that we can. ROAD AHEAD IS PROMISING!

The increased focus of Indian and global brands on manufacturing tech in India

Taiwan Expo brings the promise of fostering made-in-India products

Foreign brands, especially those from the hub of consumer technology like Taiwan, are always welcome additions to the Indian consumer tech ecosystem. We have seen brands from the country, like ADATA, Transcend, Gigabyte, and MSI, become household names over the years. This year, these brands, along with several others, flocked to Delhi for the Taiwan Expo.

Make in India a big focus at the Taiwan Expo

We spoke to several brand representatives present at the event and got their perspective on their move towards manufacturing in India. Brands like ADATA, who are already active in the Indian computer storage space, are already manufacturing their products in India and have plans on expanding their lineups in the country when it comes to manufacturing their products in the country.

There were also new names like Goldkey. Goldkey is another brand that is trying to make its way into the

Indian storage market, and it has set up its product manufacturing facility in India. Speaking to their representative at the event, I learned that the Indian government is helping the brand and manufacturing its products in Bangalore and Chennai. Elaborating on the growing popularity of India as a manufacturing hub for big-name brands from Taiwan, Mr. James

C.F. Huang, Chairman of Taiwan External Trade Development Council (TAITRA), in a conversation with us, mentioned that India has the potential to become the tech manufacturing factory for the world! Mr Huang mentioned that India is picking up manufacturing prowess, and Taiwanese compa-

nies with products like consumer electronics and even automobiles are actively flocking to the country to not only sell their products here but also collaborate with Indian companies to set up their manufacturing facilities here. Mr Huang added that the products made in India not only have the potential to go big in the Indian market but also be exported to other countries.
