Google's AI Overviews are now available in India

Google launched AI Overviews in Search earlier this year, starting with the U.S., to help people quickly find information

and discover all the web has to offer. Now, the tech giant is bringing AI Overviews to six new countries, including India. In India, Google is rolling out AI Overviews in both English and Hindi and is also introducing popular India-first features that were well-received during the Search Labs experiment: helping you easily switch between English and Hindi results with the language toggle button, and listen to responses with Text-To-Speech by tapping the 'Listen' button. <https://bit.ly/4gO3m13>

Samsung's Circle to Search comes to Galaxy A series

Samsung announced some really nice AI features this time for its flagship devices. But now, it has expanded to other devices too.

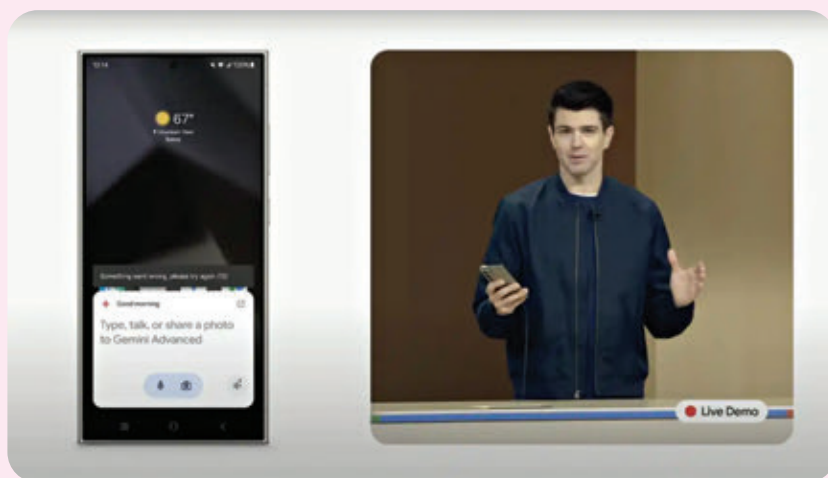

Samsung is bringing its Circle to Search feature to select Galaxy A series devices. So now AI is coming to devices that aren't too pricey either. You will also be able to use these features on Galaxy Tab S9 FE and Tab S9 FE+. You might recall how Circle to Search is a popular feature for Samsung users. I personally liked using it too. Initially, it was limited to Galaxy S24. Later, the feature was rolled out to other Galaxy devices, including the Galaxy Z Flip6 and Z Fold6. <https://bit.ly/3WY91wa>

Google's Gemini AI fails during live demo

Google was demonstrating Gemini's integration within the Calendar app and it failed to provide the information asked

—By Team Digit

Google had an embarrassing moment during its much-hyped Made by Google event as its powerful AI model, Gemini failed to provide the desired result during a live demo. Unfortunately for Google, the model failed not once but twice while trying to perform a task during the live streaming of the event. This is despite the fact that Google is hyping Gemini as the most powerful AI model till now. It even started Tuesday's Made By Google event by talking about Gemini and showcasing its new capabilities. However, when Google was demonstrating Gemini's integration within the Calendar app, it failed to provide the information asked. Instead, it just went back to the initial prompt and asked the user to enter the details again. This happened twice during the event and bunch of social media users were quick to notice it as well. "I'm watching the #MadeByGoogle

keynote right now and I'm cringing so hard. Their demos are all sketchy and the production is so basic. Poor guy that just had the Gemini demo fail on him live," one said. "The Gemini Advanced demo almost failed during the live show, but "demo spirits" saved it at the last minute lol. Pixel 9 Pro looks good and Gemini Advanced is the heart of the Android phone rn,"

another one posted on X. While the error was completely unexpected, Google used the stage to unveil Gemini Live, a mobile conversational experience that lets you have free-flowing conversations with Gemini. It allows users to ask Gemini to find new jobs for them, they can also interrupt it and have real-world conversations. <https://bit.ly/3WYFfan>
