

Google Meet will soon get a very useful AI-powered feature

Have you ever found yourself struggling to keep up with meeting notes, only to realize later that you missed crucial

details? Google Meet might just have the perfect solution for you. With the increasing reliance on virtual meetings, staying on top of important discussions has become more challenging than ever. But what if you had a virtual assistant to do the note-taking for you, ensuring you never miss a beat? Well, Google has announced that it will soon roll out a new AI-powered feature called "Take notes for me" for its video communication service Google Meet. This feature will automatically take notes during your meetings. <https://bit.ly/3WYwqOq>

Watch Google DeepMind's AI-powered robot playing table tennis

When it comes to pushing the boundaries of artificial intelligence, Google DeepMind is at the forefront, showcasing the remark-

able capabilities of AI. The company has now shared a few videos on X of its AI-powered robot competing with humans in a game of table tennis. Imagine a robot that can anticipate your every move and return shots with pinpoint accuracy—that's exactly what DeepMind's innovation aims to achieve. The integration of AI in such a dynamic sport as table tennis shows how these technologies can be adapted to tackle complex, fast-paced tasks, offering a glimpse into the future of interactive robotics and machine learning. <https://bit.ly/4cAzFB3>

Humane AI Pins are being returned faster than they can be sold

By June, only around 8,000 units had not been returned, and at the time of writing, that number has dropped closer to 7,000

—By **Ayushi Jain**

When the Humane AI Pin was first announced, it created quite a stir in the market with its innovative concept. However, the reality of its performance told a different story. After an initial wave of excitement, users quickly turned critical, and the product faced a barrage of negative reviews.

The AI Pin, which launched at \$699 in April, has struggled with disappointing sales figures and high return rates. According to internal sales data obtained by The Verge, more AI Pins were returned than purchased between May and August. By June, only around 8,000 units had not been returned, and as of today, that number has dropped closer to 7,000.

Early reviews were harsh, with David Pierce of The Verge declaring it "just

doesn't work" and popular YouTuber Marques Brownlee labelling it "the worst product" he's ever reviewed.

In response to the growing number of returns, Humane is now working to stabilise its operations and regain confidence. The company is reportedly in discussions with HP about a potential acquisition and negotiating with investors to raise debt that could later be converted into equity.

Despite bringing in just over \$9 million in lifetime sales, the AI Pin's performance

has been underwhelming. About 1,000 purchases were cancelled before shipping, and over \$1 million worth of product has been returned. This is a stark contrast to the \$200 million raised from prominent Silicon Valley figures such as OpenAI CEO Sam Altman and Salesforce CEO Marc Benioff. Humane had initially hoped to ship around 100,000 Pins within the first year.

Humane's spokesperson, Zoz Cuccias, disputed the accuracy of The Verge's financial data report but declined to provide specifics. Once a Humane Pin is returned, it cannot be refurbished due to a limitation with T-Mobile, resulting in the Pins becoming e-waste. Amidst these challenges, the company has seen significant turnover, including in key executive roles. Despite this, Cuccias assured that the company remains committed to its vision and continues to build a skilled team. <https://bit.ly/4cBbmN>
