

Realme 13 Pro+

Captures the next moment

Realme is back with another number series smartphone a few months after

introducing the previous iteration with the Realme 12 series. The Realme 13 series, like its predecessor, includes the Realme 13 Pro and Realme 13 Pro+ for now and both the smartphones come with several upgrades over the previous generation.

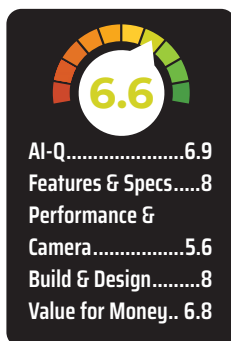

This time around, apart from the general camera and design that Realme always focuses on with the number series, the brand is also pushing for AI. There are many AI features and AI capabilities that are included with the Realme 13 and Realme 13 Pro+. Apart from this, we are getting newer cameras, along with a brighter, more durable display and a bigger battery with faster charging.

With these upgrades, however, the chipset on the "Pro Plus" variant remains the same. The Realme 13 Pro+ has the same Qualcomm Snapdragon 7s Gen 2 chipset as the one we saw on the predecessor, the Realme 12 Pro+. So yes, despite all the new AI features and better cameras, does the smartphone perform any better, since these features are themselves dependent a lot on the chipset itself. Let's take a look.

DESIGN

Now, with the design of the Realme 13 Pro+ I can't help but mention that maybe we have a bit too many similar looking smartphone in the market. The circular camera module with the curved front and back is a bit too overdone already in my opinion. But the Realme 13 Pro+ looks good. The smartphone has a nice marble-like

₹32,999

finish on the back panel and metallic finish frames. I like the details on the rim of the camera module, which give this a very classy look.

Up front, we are getting the rather standard curved hole punch display. One nice thing is that there is no chin here and the bezels are even across the

four sides of the Realme 13 Pro+. This time around, however, we are getting Corning Gorilla Glass protection with the Realme 13 Pro+ and there is also IP65 rating so in terms of durability as well, the Realme 13 Pro+ checks pretty much all the boxes.

But yes, like I said in the beginning, the round camera module with the curved back and front are just overdone, plain and simple. Now, of course there is demand for it, otherwise so many companies won't be jumping in on the bandwagon but this has made almost every phone look similar.

DISPLAY

Coming to the display, here also we

are getting a similar 6.7-inch 10-bit AMOLED display with a 120Hz refresh rate like the predecessor. However, on the Realme 13 Pro+, the display is brighter than the previous version, the Realme 12 Pro+. The Realme 13 Pro+ is rated to have a peak brightness of 2,000 nits while the Realme 12 Pro+ was rated at a peak brightness of 950 nits in high brightness mode. So on paper, there is a difference. In reality, however, the Realme 13 Pro+ scored 1022 nits under bright sunlight in our Lux Meter test. The Realme 12 Pro+, on the other hand, scored just above 700 in our Lux Meter test earlier this year.

While it is a brighter display, the Realme 13 Pro+'s display also looks more sharp and accurate. I tested the device's colour accuracy using the Calman Colorchecker analysis and the Realme 13 Pro+ showcased pretty decent colour accuracy. In the colour checker test, the Realme 13 Pro+ was able to achieve an average DeltaE of 1.6, which is outstanding for a smartphone like this, given that a DeltaE of under 3 is considered very good for smartphones. In our greyscale test also, the display performed well and showcased decent balance.

So yes, the display of the Realme 13 Pro+ is good. This is something I have noticed with pretty much all the number series smartphones from Realme at least in the last three generations. The brand is consistently able to deliver good quality displays without making too much of a fuss about it. Good stuff. Yes, there is nothing extraordinary about these like any LTPO or anti reflective coatings, but these displays get the basics right. Bright, responsive, and accurate.

PERFORMANCE

Now, this is where the Realme 13 Pro+ isn't great. We are getting the same chipset as the younger sibling, the Realme 13 Pro. Not only that, the chip is exactly the same as the predecessor, the Realme 12 Pro+. Now, in my books, this is just lazy work. Given that
