

a change. So, I would like to hear your opinions on the subject. What do you think? Has X changed for you? Do you like to go on a doom-scrolling spree on the For You page, or do you stick to the Following tab for a more controlled feed?

MONETISATION OF THE PLATFORM

Subscriptions, Super Follows, Tips, Advertising, and Video Monetisation have been prime focal points for the monetisation opportunities on X for Musk. He has acted on most of them and has plans on expanding beyond the boundaries of these and finding more pixels to charge you. X has moved on from being just a micro-blogging platform where you can put out your opinions on anything and everything, summed up in 280 characters. It is poised to be what Musk wanted it to be from the get-go – A one-stop shop for everything. I will not get started on the Blue and now, the Gold check mark saga. Too much to sum up in this space.

If you have been on the internet, you will know that there are plans to expand beyond just plain characters on a timeline and make it a platform where there's something for everyone. The effects of this vision can be seen in the expansion of ways in which creators monetise their content on the platform. The scope is vast here, but it will be interesting to see how things pan out.

Throughout the Twitter acquisition saga and its ultimate transition into X, and all its cool new offerings, Elon Musk has demonstrated a will to remain active and available in the online arena – letting the world see not just how he communicates and trolls, but also innovates and pushes the boundaries of what's possible for netizens all around the world. What he does next is shrouded in mystery, but trust Elon Musk to do something out-of-the-box in his classical break-all-the-rules fashion! **d**

WHAT'S NEXT FOR ELON MUSK?

While Elon Musk's takeover of Twitter and its subsequent transformation to X has been a major news story, his other ventures in the fields of AI and robotics are equally groundbreaking.

- **Neuralink:** It's one of Musk's most ambitious projects. This neurotechnology company is developing implantable brain-machine interfaces (BMIs) with the goal of treating neurological disorders and enhancing human cognition. Recent announcements from Neuralink include successful trials in animals, demonstrating the potential of its technology to restore lost functions like movement and vision.
- **xAI:** This is another exciting venture from Musk. This artificial intelligence research company aims to create a safe and beneficial artificial general intelligence (AGI). While xAI is still relatively new, it has already made significant progress in developing advanced AI models, and unveiled what Musk's dubbed as the "world's largest supercomputer for artificial intelligence training".

- **Optimus:** Tesla's Optimus robot is a humanoid robot that is being developed to perform tasks that are dangerous, repetitive, or mundane. The robot is designed to be versatile and adaptable, capable of performing a wide range of tasks. Recent updates from Tesla suggest that the Optimus robot is making significant strides towards commercialisation.

These projects represent just a few of Elon Musk's many endeavours in the fields of AI and advanced robotics. As these technologies continue to develop, they have the potential to revolutionise various aspects of our lives in the near future.
