

VISHESH HANDA

Founder & CEO,
NewJaisa

Q When did you launch New Jaisa, and what are your thoughts on the refurbished gadget market?

A NewJaisa technologies was launched in 2020. We were Covid babies, and the divide between Haves and Have nots was so stark – only 9% of India could afford to come online for education as affording a PC was a luxury for most of Bharat. We took up the challenge of providing a fully featured AIO for less than ₹13,999, a price point we thought will help many. With five people, 2000 sq ft of space, few bucks and a lot of passion to deliver we got the product ready in 7 days flat and to our own surprise, within a week we became the best seller on Amazon. Four years on, from 2K to 50K sq ft of space, from 5 to 500 employees, from 1 to 250 SKUs, from 0 to ₹62 Cr revenue – it's been a rocketship!

Q Can you describe your typical customer for refurbished gadgets?

A Our typical customers are price-conscious individuals, small businesses, educational institutions and

students who need reliable technology at a lower cost. Over time, we've noticed a growing trend of environmentally conscious consumers who prefer refurbished gadgets as a sustainable choice. Additionally, there's been an increase in demand for higher-end refurbished gadgets as customers realise they can get premium products at a fraction of the cost.

Q How do you use technology and AI to better serve your customers?

A Technology and AI play a vital role in our operations. We use AI to automate the grading and refurbishing

process, ensuring consistency and accuracy. Additionally, data analytics helps us understand customer preferences and optimise our inventory. AI-driven customer service tools allow us to provide timely and personalised support, enhancing the overall customer experience.

Q Biggest challenges and opportunities in India's refurbished gadget market?

A The biggest challenges include educating consumers about the benefits of refurbished products, ensuring a consistent supply of high-quality devices, and navigating the competition from large unorganised markets which rely on illegal imports. However, there are exciting opportunities in the growing awareness of sustainability, increased demand for affordable technology, and the potential to expand into new markets and product categories. India's PC penetration at 13% is significantly lower than USA (81%), China (47%) and EU (81%) – presenting a high growth potential. Refurbished laptops present a ~\$2.5 billion market opportunity by FY33, and Indian Organised Sector expected to penetrate ~50% of the market by 2028, up from ~10% currently. **[d]**
