

Open AI Strawberry o1

Exploring the five ways it's better than ChatGPT 4o

—By **Satvik Pandey**

The race to perfect generative AI models and develop ones that can mimic the human brain is on! Research conglomerates across the board are rushing to release their AI models, which aim to perfect the process of complex problem-solving by becoming increasingly more intuitive to use. OpenAI has been a leader in this space and has made very capable models like GPT-4o available to the public. The latest addition to their arsenal is OpenAI o1, also known as OpenAI Strawberry. As this new AI model makes way into the hands of the regular folk, let's take a look at the five key ways in which Open AI's Strawberry claims to be better than ChatGPT 4o –

OpenAI's Model o1 is more resilient to generating harmful content

Ever since the inception of generative AI, bad actors have been trying to bypass the guardrails set in place to prevent the generation of harmful content. The most common way of doing this is – jailbreaking. Taking note of the incessant problem of jailbreaking AI, OpenAI, with their o1 model, has added enhanced protection against jailbreaking and other ways in which bad actors might try and generate harmful content using the generative AI model.

By deploying the learnings from their internal "preparedness framework" and red-teaming amongst a host of processes, OpenAI was able to ensure that the model stays better protected against generating harmful content. In their documentation

about o1, they noted that the model scored 84 points on a scale of 0-100, which is significantly higher than that of GPT-4o, which managed a score of just 22 points.

Reinforcement learning using chain of thought – OpenAI's secret sauce

One of the key differentiating factors for OpenAI's new model, o1 is its ability to closely mimic the human process of

a problem's evaluation using a chain of thought. To ensure that the model retains its claimed high accuracy levels, OpenAI has introduced the methodology of reinforced learning for the model. With this, the model is able to identify and learn from its mistakes and also zero in on the most effective strategies for generating responses.

In the demonstration published by OpenAI in the release document for the new model, they showcased

Performance of GPT-4o, o1-preview, and o1-mini on the jailbreak evaluations
