

Sennheiser Accentum TWS

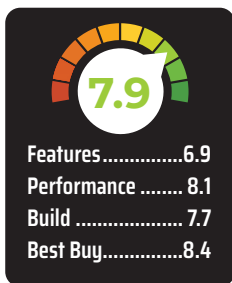

Bright sound, dimmer shine of the features

The premium TWS market has expanded significantly in the last couple of years, with the delta between the performance and features of the in-ear earphones at the lower end of this price range being very small compared to the flagships of the world. Brands across the board are trying to be the flagship experience for the lower-end of the mid-range market by launching products that essentially pack the same hardware as their more premium counterparts, which translates to a premium experience for the user. Or, they are bringing the flagship features and performance to their more affordable offerings. The best example of this can be seen in the Sennheiser Accentum TWS in-ear earphones.

The Accentum line of audio products by Sennheiser started with the introduction of the Sennheiser Accentum Plus headphones in India. Later, we saw the launch of the regular Sennheiser Accentum cans, which were a little more diluted in terms of their features compared to the Accentum Plus. However, both these headphones brought a watered-down experience of the premium Momentum 4 Wireless headphones to the sub-₹15,000 price range. The headphones remain a solid offering in their price bracket and are praised by many but criticised by few, offering the experience of owning Sennheiser's flagship over-ear wireless headphones on a budget.

Now, joining the Accentum Plus and Accentum headphones is the Accentum TWS. These in-ear earphones showed up at the Digit Test Centre some time ago, and when I got my hands on them for review, I wanted to see how they fared in

₹13,990

their own price range and how the experience was when weighed against the expectations set by its other Accentum brethren. So, I put these in-ear earphones through the grinders of the Digit Testing process, and here's what I found out –

BUILD AND DESIGN

Honestly, I am a fan of these in-ear earphones. As someone who isn't pleased by in-ear earphones that lack a stem, the Sennheiser Accentum TWS really made me reconsider my choices. The fit was on point for me, and in our signature headshake test, devices by colleague Dhriti fared better than any other non-stem earbuds that I have tried in my time here. Of course, as always, your mileage may vary, given the shape of your ears. However, I sampled a small group of people, and all of them were satisfied with the fit of these in-ear earphones, albeit with different ear tips of different sizes.

A mild word of caution for the folks with small ears. The buds are slightly larger, and you might experience some discomfort when wearing these in-ear earphones for longer periods of time. It is to be noted here that Sennheiser has made sure that no one is left out and has included four different pairs of silicon ear tips in the box. A big thumbs up here!

The case is also nice and pocketable, and given the battery it houses, which I will get to later, the size and the weight are pretty impressive. If you have read my reviews in the past, you would know that I am a sucker for a metallic hinge in the case of any TWS in-ear earphones. However, the plastic hinge on these earphones did not make me worried. I docked some brownie points here, though, but the overall fit of the case, the choice of materials and the heft impressed me.

Talking about the build quality of the case. The earbuds also have the same materials as the case, and the IP54 splash resistance means that they will fare well when exposed to the elements for a short period of time. For gymming, go ahead and sweat it out with these earphones on. In the rain, I would suggest exercising caution. And, in either of the scenarios, keep the case secure, as the IP rating is only for the earbuds.

All in all, the build and design of the Sennheiser Accentum TWS are solid, and whatever ground they lost was in the form of brownie points, which I would have awarded if Sennheiser had included a metallic hinge on the case.

FEATURES

When it comes to features, you can expect a similar set here to any other Sennheiser-branded pair of in-ear earphones. You have a solid set of features baked into the Sennheiser Smart Control app. They are limited but robust. Nothing to write home about. What is there, is sufficient for most.

PERFORMANCE

Coming to the biggest point of focus of this review, is the performance of the Sennheiser Accentum TWS. The sound signature of the Sennheiser Accentum TWS is fairly well-rounded. In true Sen-
