

nheiser fashion, the sound coming from these earbuds is bright, and the bass is also in control, as the mids come fairly close to our baseline reading of the flat response recorded using pink noise. The upper-mids and the highs have a significant boost to them out of the box, which means that you will definitely enjoy listening to genres like rock and classical on these in-ear earphones.

To see how they would fare in day-to-day use, I played through our playlist, which includes songs from across the genres, and I was pleasantly surprised to see how these in-ear earphones fared when I was listening to tracks like *Rescue Me* by One Republic and *Selkies* by BTBAM. The vocal reproduction and the metal instrument density were great on these in-ear earphones. Moving on to the staging and the overall detailing of the sound produced by these in-ear earphones.

The details are well represented across genres, with songs like *Uptown Funk* by Bruno Mars packing an ample amount of punchy bass and more vocal forward, and metal instrument-heavy music from bands like Linkin Park also sounds pleasant. Additionally, you can tune these earbuds to your liking, and the mechanism that Sennheiser uses involves you playing your favourite track and then tuning the earbuds, making sure that you get the sound that you will actually love over the period of time. The staging is fairly expansive, and it added to the overall immersion when I was watching movies and content that utilises the grandeur added by sound design.

If you are wondering how is the sound signature of these in-ear earphones against similarly priced TWS in-ear earphones offered by other brands, here's a quick look at the sound signature graphs that will give you a quick idea of how they fared –

Active Noise Cancellation

As for the ANC, it is definitely serviceable in most conditions. The earbuds do a great job when working with low-pitched sounds and also tackle high-pitched noises well! If you are rocking these on

your next flight, then you will definitely be least bothered by a crying child on board if it is 4-5 rows away from you; any closer, and you will have a fair amount of the noise seeping through. The low-pitched drone of the engine will be drowned out completely. In day-to-day use, while commuting, these earbuds will hold their own.

Microphone Performance

The microphone on these earphones will not blow your mind, but if you are in a noisy office, you will not get any complaints from the receiver of your calls either. Sennheiser's prowess in making quality audio products shines through here, as the mic on these in-ear earphones left my voice un-altered for the most part while trying to work around the background noise coming in.

BATTERY LIFE

The battery life of the Sennheiser Accentum TWS, especially after considering how light the earbuds are and the pocketability of the case, is pretty impressive when you keep them in isolation. The total battery life of the earbuds, including the case, when the volume was set to 50 per cent, and ANC turned on, came out to be 19 hours in total, which equates to about 4.5 hours on the buds themselves. It seems pretty good for a pair of lightweight and pocketable earbuds. However, when compared to the likes of the OnePlus Buds Pro 3, which clocked in 25.5 hours total in our testing, the Sennheiser Accentum TWS leave something to be desired.

You get a USB-C port on the back of these earbuds, which you can use to charge these earbuds, with the brand claiming that the fast-charging tech on these earbuds gives you around 1 hour of playback in just 10 minutes of charge. A quality-of-life feature that I really appreciate on these earbuds is the inclusion of Qi wireless charging, which saved me the brain space of remembering that I needed to charge the earbuds. I would just come home at the end of the day and plonk them onto my wireless charger, and breeze through the day.

SHOULD YOU BUY THE SENNHEISER ACCENTUM TWS?

This was the most tricky part for me when writing with these earbuds. The Sennheiser Accentum TWS in-ear earphones hold the Sennheiser legacy well and also hold their own when you factor in the fact that they are a part of the brand's more pocket-friendly yet taxing Accentum lineup, whose headphones set the bar really high. These TWS in-ear earphones sound great and come with a robust set of features and great build and design. All these shine like a beacon in the sky of the TWS market only when you are just evaluating them in a vacuum.

Pit them against the likes of the Nothing Ear (2024) and the recently launched OnePlus Buds Pro 3, and the lack of a wider gamut of features and some other QOL inclusions starts to hurt and come to the surface. If you are looking for a pair of TWS in-ear earphones which would last you a lifetime as you maintain a low profile in the public when it comes to the design, and like the Sennheiser sound signature, with the sound being on the brighter side, you will be completely satisfied with Sennheiser Accentum TWS. However, if you want a cooler-looking pair of TWS, the obvious choice would be the Nothing Ear (2024), and if you are looking for a true flagship experience, turn to the OnePlus Buds Pro 3 or the slightly older offering, the Samsung Galaxy Buds Pro2.
