

Hisense E6N LED TV

Affordable excellence or just another option?

₹36,999

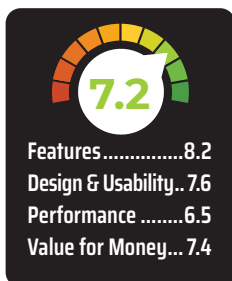

Hisense E6N is an affordable LED TV that

runs the Google TV interface and comes with some interesting gaming features like VRR and ALLM. While the affordable TV landscape is quite competitive and dynamic, if you are looking for an option from a familiar brand, the Hisense E6N must have turned up on your list. The Hisense E6N stands out as a solid option from a well-known brand. But is it truly worth its price? How does it fare in terms of picture quality and overall performance? Let's answer these questions and more in this detailed review!

DESIGN AND REMOTE

The Hisense E6N LED TV has slim bezels on three sides. I noticed that the edges of the display cover glass are bare and not shielded by side bezels, which subtly enhances the design. The metallic chassis extends beyond

the glass by a few millimetres to provide a safeguard. The stand at the bottom is made of plastic and offers sturdy support. Frequently used ports are side-facing but are positioned towards the centre. This means they will be a tad difficult to access when the TV is wall-mounted.

I really like the Hisense remote that comes with the E6N. It's ergonomic and the white D-pad makes it easy to use in the dark. It includes hotkeys for five popular apps: Netflix, YouTube, Prime Video, Hotstar, and Sony Liv. There is also a customisable Media key, which you can assign to any app or function of your choice. The Menu button provides quick access to useful settings as an overlay while content is playing - a feature we truly appreciate.

DISPLAY QUALITY

The Hisense E6N has a basic LED LCD Display. Our unit has a VA

panel and we recorded a contrast of 3817:1. The peak display brightness reached approximately 300 nits in the Dynamic mode (HDR) and dropped to just 260 nits in the more accurate Cinema mode and Filmmaker mode which has relatively warmer white. This is not enough brightness for an impactful HDR experience, but that's also the case with most of the affordable HDR options that we have tested.

The TV can reproduce roughly 90% of sRGB colour space and roughly 77% of DCI-P3 colour space, which is standard for affordable LED LCD TVs. The viewing angles are not very wide and we noticed loss of luminance and colour when viewing off-axis.

HDR AND SDR PICTURE QUALITY

We use Spectral C6 HDR2000 colourimeter, VideoForge Pro pattern generator, and Calman Ultimate software to test TV displays. The Hisense E6N has reasonable colour accuracy for the price but greyscale and luminance errors are considerable and as a result, colours look washed out.

In SDR we measured an average delta error of 4.6 and a maximum delta error of 8.5 which is decent for affordable TVs. Super-resolution which uses AI to subtly sharpen object edges in real-time is enabled by default. Even after disabling it, the picture felt slightly over-sharpened.

In HDR 10, the TV tracks the EOTF curve brighter than the reference. The colour accuracy also drops further. We must also mention that if we discard the luminance error, colour accuracy stats improve considerably. Also, we noticed some banding and posterization artefacts in HDR content.

The TV also supports Dolby Vision HDR, but once again the overall Dolby Vision experience is not up to the mark. In dark Dolby Vision sequences, the Dolby Vision Bright overbrightens the shadows and the Dolby Vision Dark completely crushes dark details. We often found ourselves switching modes and settings to get the picture
