

Vivo T3 Pro

Pro performance, ultra battery life

The Vivo T3 Pro 5G has entered the competitive mid-range smartphone market, battling against formidable competitors like the POCO X6 Pro, Nothing Phone (2a), and OnePlus Nord CE4. Priced starting at ₹24,999, the T3 Pro attempts to deliver “pro performance”, appealing to users who seek high performance and longevity in their devices. With a Qualcomm Snapdragon 7 Gen 3 chipset, a large 6.77-inch curved AMOLED display, and a substantial 5,500 mAh battery, the Vivo T3 Pro looks impressive on paper. It’s also important to note that the T3 Pro shares several specifications with the iQOO Z9 Pro, a recently launched phone from its sister company. So, in this review, I will explore the Vivo T3 Pro thoroughly to see if it can capture the masses’ attention and make a mark in the cutthroat mid-range smartphone segment.

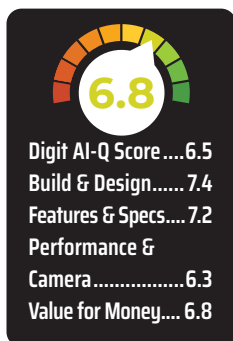

PRICE AND AVAILABILITY

The Vivo T3 Pro is going on sale starting September 3, at noon. The phone is priced at ₹24,999 for the base 8 GB + 128 GB variant, and it will cost ₹26,999 for the top-end 8 GB + 256 GB storage variant. The phone is available in two colours – Sandstone Orange and Emerald Green. It is available for purchase on Vivo India’s website, Flipkart, and select retail locations. There’s an introductory offer that gives HDFC and ICICI card holders a ₹3,000 discount. You can also avail a ₹3,000 exchange bonus and a no-interest EMI plan for up to six months.

BUILD AND DESIGN

The Vivo T3 Pro 5G features a sleek design. It boasts a leather back panel with golden accents, and the aesthetics will be appreciated by many, I’m sure,

₹24,999

but personally, it looks a bit too garish for me. Particularly, the Sandstone Orange colour variant, which is a bit too vibrant for my liking. The gold border that runs around the camera module is a tad too gaudy, in my opinion, as well; but looks are subjective, so it’s up to you if you enjoy the aesthetics of the Vivo T3 Pro.

At just 7.5 mm thick, Vivo claims the T3 Pro is one of the slimmest curved phones in its segment. Thanks to its slim profile, the T3 Pro’s in-hand feel is fantastic, and the leather back is quite grippy. The Vivo T3 Pro also does not compromise on build quality. The device feels solid and well-constructed, exuding a sense of durability.

However, it is worth noting that the ultra-thin design comes with some trade-offs, particularly in terms of handling. Users may experience accidental touches along the edges, a common issue with curved displays. This can occasionally disrupt the user experience, especially during one-handed use or gaming.

Overall, the Vivo T3 Pro’s design and build are strong selling points, even though I’m personally not a huge fan of the colours and the look. The phone also comes with an IP64 rating, which means there’s some level of water resistance baked in.

DISPLAY

The Vivo T3 Pro is equipped with a 6.77-inch curved AMOLED display that delivers vibrant colours. However, its FHD+ resolution is bested by the POCO X6 Pro which has a 1.5K resolution, making it a tad sharper.

With a refresh rate of 120 Hz and a peak brightness of 4,500 nits, the display provides smooth motion response and excellent visibility, even in bright outdoor conditions. When I tested the display for brightness, I got an impressive reading of 1,466 nits in Auto Brightness mode, making this one of the brightest displays in the mid-range segment.

The display supports HDR10+ and Widevine L1, so you can watch your favourite shows on OTT platforms in HDR. Colours look vibrant; slightly unnatural, but they certainly pop. Moreover, the contrast levels are good and the viewing angles are excellent. So, while the T3 Pro may not have the sharpest display in this price segment, its high brightness levels and good HDR reproduction make up for the lower resolution.

PERFORMANCE AND SOFTWARE

Under the hood, the Vivo T3 Pro is powered by the Qualcomm Snapdragon 7 Gen 3 chipset, coupled with 8GB of RAM. The chipset is also found on the OnePlus Nord CE4, so you can expect similar performance. The device is available in two storage variants, 128GB and 256GB, providing good enough space for your apps, photos, and videos.

However, 12 GB RAM would have been a better option as the phone is also targeted towards gamers. Additionally, the phone sports UFS 2.2 storage, so the read and write speeds aren’t nearly as good as the OnePlus Nord CE4’s UFS 3.1 storage. And the POCO X6 Pro’s UFS 4.0
