

Redmi Pad Pro

Reasonably functional

So tablets is a space where Android brands are yet to make a significant dent.

While still far away from where Apple's iPads stand in the market, there are quite a few very good Android tablets in the market. Xiaomi is one brand that has brought pretty decent tablets to India. Starting with their first tablet in the market, Xiaomi has consistently offered a very good value for money, leading up till the last device in the market, the Xiaomi Pad 6.

Last year, the Xiaomi Pad 6 was a nice addition to the Android tablets lineup in the market. It brought a nice combination of premiumness and practicality at a decent budget of under Rs 30,000. This year, Xiaomi aims to bring the same look and feel at a more affordable price tag with the Redmi Pad Pro.

Now, I have been testing the Redmi Pad Pro since the last few days and even used it as my work device for a few days, and I have many thoughts. In this review, I will try and give you a fair idea as to how the Redmi Pad Pro looks, feels, and performs – both as a work device and as an entertainment device.

DESIGN

The design of the Redmi Pad Pro is very standard. It looks like any other tablet out there from the front. There are slightly thick but symmetric bezels all around. The display is bigger than last year's Xiaomi Pad 6 at 12.1 and the front camera is placed in a horizontal orientation, which is ideal for video calls and online conferences.

On the back, we get an aluminium build, along with two large circular camera cutouts, but one is for the LED

₹28,999

flash. Slightly deceiving since from a distance, you'd easily mistake it for having two cameras. I like the finish on the back panel. The metal build feels very premium to the touch, and the weight of the Redmi Pad Pro is also fine. It's not the lightest

tablet at 571 grams (for the 5G variant), but it's also not the heaviest I have used. Holding it for longer does get uncomfortable.

We are also getting speaker grilles on both the top and the bottom of the tablet, and there is the "Dolby Vision Atmos" branding on the frame, which we have seen earlier. The frames are also made of aluminium, and we are getting Corning Gorilla Glass 3 protection with the Redmi Pad Pro.

So overall, there is nothing special in terms of the design. I like that there is a certain premium feel to this. Given that it is a product from Xiaomi's Redmi line

of products, the premium look and feel is pretty good.

DISPLAY

Coming to the display, we are getting a 12.1-inch IPS LCD display with the Redmi Pad Pro. This comes with a 1.5K resolution (1600 x 2560 pixels) and a 120Hz refresh rate. On top of that, we are getting Dolby Vision HDR along with Dolby Atmos. So in the numbers game, the Redmi Pad Pro has things covered. But how was my experience? Let me quickly tell you.

So watching movies and TV shows on the Redmi Pad Pro was a great experience. Despite an LCD panel, the contrast is pretty decent and you can see some of the finer details in all your HDR movies and TV shows. Yes, dark scenes don't look as good as an AMOLED panel, but it's not much of a deal breaker.

Even the brightness is pretty good for a tablet. I tested the Redmi Pad Pro in bright sunlight and the tablet showcased a maximum luminance of 459 outdoors, which is good enough for a 12.1-inch LCD display. So even though chances of the Redmi Pad Pro being used outdoors are less, the sunlight visibility is decent.

Coming to colour accuracy, this is again an area where the Redmi Pad Pro is pretty decent. It may not be the best, but it represents colours with a certain level of accuracy, so it's good. I put the Redmi Pad Pro through the Calman ColourChecker Analysis and the tablet was able to achieve an average DeltaE of 2.2 and a maximum DeltaE of 6.1, which was the value for dark blue. This means that the display on the Redmi Pad Pro doesn't represent dark blue colour accurately.

However, on average, the colour representation is pretty decent. So yes, this is a good enough display for a mid-range tablet. It's very good for watching movies and TV shows, it is super responsive with the 120Hz refresh rate and it also represents colours pretty accurately.
