

PERFORMANCE AND BATTERY

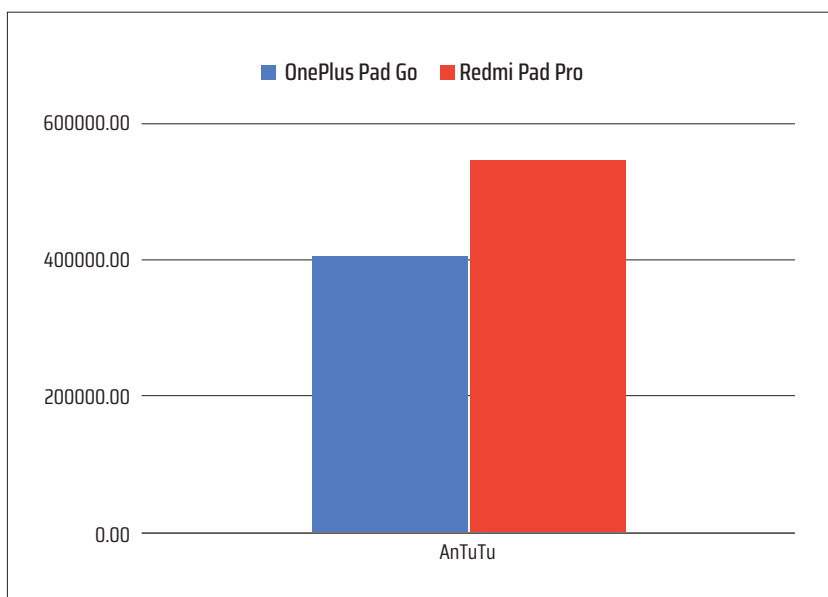

The Redmi Pad Pro is powered by a Qualcomm Snapdragon 7s Gen 2 chipset paired with 8GB of RAM and up to 256GB of internal storage. I tested the performance and ran multiple benchmarks on the Redmi Pad Pro and the tablet came consistently ahead of its closest competitor, the OnePlus Pad Go, which comes with a MediaTek Dimensity 9000 SoC.

Now, since there aren't many options to compare the performance with, the Redmi Pad Pro does well in terms of day-to-day performance. I did pretty much everything a person would do on a tablet. Be it work, entertainment, gaming, or just creative stuff like sketching and writing notes. To me, this seemed pretty decent for all these tasks. But of course, nothing is perfect.

So during my usage of the Redmi Pad Pro, there were a few things that especially bugged me. First and foremost, the tablet heats up while running multiple apps at once. Now, if you're using it for work with the keyboard, you won't notice the heating but if you're gaming or anything that requires you to hold the tablet, you will notice the heating. But then again, the form factor only allowed me to hold it on different sides and most of the heating was happening in the middle of the device.

Furthermore, despite a 10,000mAh battery, I found the Redmi Pad Pro to have a rather disappointing battery life. During one day's extensive work usage, the Redmi Pad Pro drained half of its battery in about 2 or 3 hours, meaning an on-screen time of about 6 to 7 hours overall. Now, this is a pretty average score in the overall set of things, but in our tests, the Redmi Pad Pro didn't do all that well.

The tablet drained 16 percent of its battery while navigating on GPS for an hour. Further, it drained 6 percent battery while playing a YouTube video on the highest possible resolution for 30 minutes, while a Call of Duty: Mobile gaming session of 15 minutes drained 7 percent of the battery. Now again, these are decent numbers if we look at the

overall picture, but the Redmi Pad Pro has a bigger battery than many other competitors and with Xiaomi's claimed battery optimization with HyperOS, this disappointed me a little bit.

But despite the rather average battery life and decent performance, the Redmi Pad Pro is a very good tablet at its price. I was able to use this as my work machine for about 3 to 4 days and I must say that despite a few things here and there, it did serve the purpose rather well. Yes, I wouldn't use it as my primary work device, but it can very easily be my work device during travel. It is portable, it is fast, and it can run multiple apps at once.

Even the keyboard cover that Xiaomi sent with the Redmi Pad Pro is very good quality. Yes, it is a bit small for typing long documents and I did experience a lot of mistypes with this keyboard, but that could be because of my typing speed, which is somewhere around 65 to 70 words per minute.

Everyone else around me in the office or at home really liked how the keyboard felt. Even the key travel is better than most tablet keyboards that I have tested and is very close to that of a conventional laptop.

However, the lack of a trackpad takes away a few points in terms of using it as a work machine.

VERDICT

So overall, I'd have to say that the Redmi Pad Pro is a very good value for money product. It has a decent design with the aluminium build that adds that premium touch to the build quality. It has a pretty good display which is sharp, responsive, and sufficiently accurate at the same time, and the performance is good enough for all kinds of users.

Yes, making it my work machine for a few days did involve a lot of getting used to and I really missed a trackpad on the keyboard that Xiaomi has given. But the multi-tasking options, the stylus support, and the ease of use, all at a price of under Rs 25,000, make this a brilliant value for money offering. The Redmi Pad Pro scored almost 75 out of 100 in our Digit Test, and that is a very good score so I have numbers to back my thoughts here.
