

Acer Swift 14 AI

Acer announced its new Intel Lunar Lake-powered lineup with two Swift series models – the Swift 14 AI and Swift 16 AI. We checked out the Acer Swift 14 AI, and the first thing that struck us is that the overall chassis and design are pretty much the same as the Swift AI powered by the Qualcomm Snapdragon Elite SoC. What is different, though, is that the Intel Core Ultra Series 2-powered laptop promises higher battery life at a staggering 29 hours on

a single charge and is lighter at 1.26 kilograms. The Acer Swift 14 AI is the highest when it comes to battery life claims on a thin and light laptop that we've got our hands on to date.

Another cool thing about the Acer Swift 14 AI is the NPU activity indicator, which glows whenever the NPU is in use. This is a neat feature, as it kind of alerts you when any applications are making use of the NPU. We see it being very helpful for testers and power users.

MSI Claw 8 AI Plus

MSI did launch the Prestige, Summit, and Venture series of Intel Lunar Lake-powered laptops at IFA 2024, but what caught our attention was the MSI Claw 8 AI+. MSI launched the Claw 7 on the Intel Meteor Lake series at CES 2024, and now they have upgraded the Claw to a larger, more beefed-up 8-inch handled Windows 11-powered gaming console with the MSI Claw 8 AI Plus. The Claw 8 is going bigger on every aspect – a larger 8-inch display, a big jump in the battery pack with an 80Whr (compared to the 53Whr in the Claw 7), and it will be powered by the latest Intel Lunar Lake-based Core Ultra 200V series processor and will also run

on a faster SSD besides offering an additional Thunderbolt 4 port. Surely, we expect the Claw 8 to offer a much better gaming experience and battery life without any thermal throttling issues, thanks to the much more efficient and graphically advanced Intel Lunar Lake platform.

During our brief encounter with the MSI Claw 8 AI Plus, we found the console to have a similar design and overall in-hand feel as the MSI Claw 7. Sure, the device has got a bit heavier, but the balance is well maintained thanks to the increase in volume. MSI has not launched the device yet; they've announced it, and we expect the official launch to be in early 2025.

Dell XPS 13

We got our hands on the latest Lunar Lake-equipped Dell XPS 13 at the demo area, and the first thing to report is that all the changes are on the inside. Dell has upgraded the innards of the XPS 13 with Intel Core Ultra 200V series processors, with configurations going up to Intel Core Ultra 9 288V with 32GB of memory. The fact that Dell has kept the overall design and chassis the same is a very good thing. We love Dell's seamless XPS 13 design with the invisible touchpad. It does

have a unique appeal, and Dell has also done a very good job with the implementation. Dell claims 26 hours of battery life on the Dell XPS 13 with WiFi on and streaming Netflix at 1080p resolution. We'd like to test that claim ourselves to be doubly sure on that number, but we do

expect the Intel Lunar Lake-powered XPS 13 to take a substantial jump across performance and battery life compared to the earlier Intel Meteor Lake-powered XPS 13. There's no official information on the India launch yet.
