

have a Turbo boost of 5.5 GHz, a Turbo Boost Max of 5.6 GHz and a Thermal Velocity Boost going up to 5.7 GHz. If you've gone through the 14900K marketing then you'd have the 6 GHz number mentioned several times across their literature. That has now dropped with this new generation of processors. The iGPU with its 4 Xe Cores totals up to 64 Execution Units and they start off at 300 MHz and go all the way to 2 GHz on the 285K and 265K while the 245K gets about 1.9 GHz of boost.

As for memory support, the Arrow Lake processors can handle CUDIMM (Clocked Unbuffered DIMM) as well as CSODIMM (Clocked SODIMM). These are the new memory technologies that have a clock signal source on the memory sticks themselves compared to previous memory technology which relied on the CPU for the clock signal. Officially, the Intel Core Ultra 200S processors can handle up to DDR5-6400 CUDIMM and up to DDR5-5600 UDIMM.

As for the platform, we get a new 800 series chipset based motherboard with the first wave only featuring the Z890 chipset with other variants coming later in the launch cycle.

PERFORMANCE

We start off with Cinebench 2024 which is based on Maxon's Cinema 4D software, designed to evaluate a processor's performance in rendering complex 3D scenes. It tests both single-core and multi-core capabilities, highlighting how efficiently a CPU handles multi-threaded tasks common in professional rendering workflows. In both runs, the Core Ultra 9 285K bested all the competition including its predecessor. The same was seen in Cinebench R23.

In Blender, the 285K showed quite an improvement over the previous gen and even beat the 7950X3D which stood at the top of the chart. In V-Ray, the same behaviour was observed but the 9950X beat the 285K for the top
