

is decent for the price, you will need to invest in an external sound system if you are particular about audio nuances.

VERDICT

The Blaupunkt QLED QD7030 TV features a large 65-inch display at a very reasonable price, though it does come with a few trade-offs. These flaws, however, seem excusable for the price. The display performs well for SDR

most general consumers are accustomed to cooler whites, this should not be an inconvenience; however, it does affect the overall score negatively. There is a 20-point white balance correction toggle under advanced picture settings, but it didn't prove effective in fixing the white point. The TV can render dark and mixed SDR scenes quite nicely.

The TV supports Dolby Vision and other popular HDR formats. Once again, the colour temperature in the Movie present is cooler than standard. We recorded an average Delta Error of 4 and a maximum error of 10.2.

Colours in HDR content are great, but due to limited contrast and peak brightness, the overall HDR impact is mediocre. The TV also struggled to render scenes with both bright highlights and shadows effectively. The performance in bright Dolby Vision scenes is decent and the dark scenes are rendered brighter than expected due to raised black level.

PERFORMANCE AND SOFTWARE

This Blaupunkt TV offers decent performance configuration for the price which includes quad-core processor, 2GB RAM and 16GB storage of which 11GB is free for users. It is not however a snappy TV and feels sluggish while multitasking – say when you are playing content and are trying to switch picture modes

simultaneously. Or when you are trying to fast-forward a movie.

Blaupunkt uses the familiar Google TV interface with minimal customisations. The software is based on Android 11 and standard Google TV perks like Google Assistant, Integration with the Google Home app, Chromecast Built-in, and others work well. There are several preloaded apps on the TV and some of them like the File Manager are useful.

We didn't face any issues casting from popular apps on Android phones and iPhones. Apple Airplay is not supported on the TV, so screen mirroring from Apple devices will not be as seamless. Voice commands via remote control worked well.

GAMING AND AUDIO

The TV lacks gamer-centric features like VRR and ALLM but delivers a decent casual gaming experience. In our testing with the PS5, gameplay was generally smooth. The HDR experience, however, was not very impactful.

The audio quality from the TV is decent, especially considering its price point. The balanced sound profile adequately works for a range of content including movies, TV shows and casual music listening. Dialogue clarity is average and sometimes it was hard to understand the content in scenes with complex soundscapes. While the audio

content, offering good colour accuracy and wide viewing angles. HDR performance is somewhat underwhelming due to limited brightness and contrast, which is common among affordable TVs. The design is appealing, and the build quality feels quite reassuring.

You get 2GB of RAM and a sufficient 16GB of storage, but the performance can feel sluggish, especially when switching between apps. The TV is responsive in casual gaming, and the experience with consoles is decent, despite lacking gaming features like ALLM and VRR. Overall, this TV offers a balanced feature set that caters well to everyday users, but it may not meet the expectations of more demanding users. If a large 65-inch screen is your priority and you're constrained by a budget of under Rs. 50K, it's worth considering.

–Deepak Singh

SPECIFICATIONS
