

frequencies to get lost. Drum cymbals and higher-pitched sounds, for example, are much quieter, which can make the music feel less dynamic.

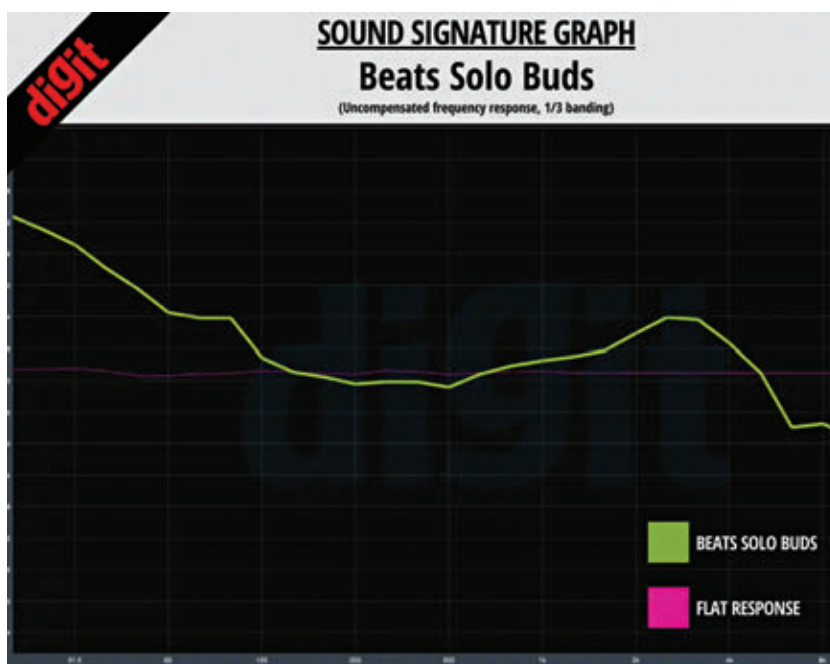

Moreover, the earbuds' strong focus on upper mid-range and high frequencies makes them less ideal for long listening sessions. If you crank up the volume too high, this emphasis can feel overwhelming or even harsh, especially in songs with heavy vocal or guitar presence.

Ultimately, while the Beats Solo Buds deliver a V-shaped sound that will satisfy many mainstream users, they fall short for those seeking the clarity and balance found in higher-end audiophile earbuds.

As for the microphones, the Beats Solo Buds fall behind here too. I ended up sounding very hollow on calls and even in voice recordings. Additionally, if you take calls outdoors, the earphones don't do a good job of dampening environmental noise.

BATTERY LIFE

As mentioned before, the Beats Solo Buds' case has no battery, so it solely relies on the batteries inside the earbuds. In my testing, at 70% volume,

the earbuds lasted 16 hours and 35 minutes. The lack of a charging case also means you cannot charge the earphones when you're using them. The move to not include a battery in the case is very odd and it will likely confuse users who are used to getting a few additional recharges of our their TWS' case.

The Beats Solo Buds support fast charging. A 5-minute charge provides 1 hour of playback time, which is pretty speedy.

VERDICT

The Beats Solo Buds fall short in many areas, making them a perplexing choice in the competitive TWS market of 2024. Despite their excellent fit and portability, they lack essential features like Active Noise Cancellation, multipoint connectivity, and an IP rating. The absence of a battery in the charging case is particularly disappointing. While the sound quality is passable for casual listeners, it doesn't meet the expectations set by the price tag of ₹6,900. Overall, the Beats Solo Buds offer limited value for money and miss out on many modern conveniences.
