

mance, but the competition was tight in CPU benchmarks. From what we can see in the numbers, the phone has slower storage than the Nord 4.

However, the real-life implications of these performance numbers are not as significant as they would seem to be. The phone works well, and in all the subjective criteria like ease of use, snappiness, and daily tasks, it scored really well. The phone is responsive and will handle whatever daily workload you send its way with ease. When I was gaming on the phone, it did heat up quite a bit when in a room with the AC set to 21 degrees Celsius without the cover on. However, when the ambient temperatures were lower, around 16 to 18 degrees Celsius, the phone's heating was more manageable. In our CPU throttling test, the phone throttled down to 87 per cent of its peak performance, and I could see that being replicated when gaming and recording high-res footage.

Now, being an audio nerd primarily, I put the speakers and the microphone of this phone through its paces as well. The stereo speakers on the phone delivered ample loudness for content consumption in a quiet space, and the separation of audio between the two speakers was also on point for the most part. However, due to the positioning of the bottom speaker next to the charging port, the directions of the footsteps in games do go out of whack. But that is just a nitpick. The microphone performance of the phone in quiet environments is on point. In noisy environments, it holds its own.

DISPLAY

The display on the Vivo T3 Ultra is fairly colour-accurate and will fare well for most people when it comes to content consumption. The phone comes with a 6.78" 1.5K 120Hz curved AMOLED screen with 4,500 nits peak brightness and HDR10+ support. When put to the test, the phone recorded a peak brightness of 983 nits of peak brightness and 9 nits of dims. It is fairly bright for day-to-day use, and in bright sunlight, it is fairly legible. The text is crisp and the visuals also look great for the most part. It did struggle a bit in darker scenes, but in ideally lit ones, it was great!

CAMERAS

Coming to the cameras, they well for the most part in well-lit conditions but failed to capture the details that I would want it to in dimly lit conditions. In ultra low-light conditions, the camera pales in comparison to the other conditions as we will see. Here, the details are lost and there is a lot of smudging in areas where there should have been creases. When you use 2x Zoom on the primary camera in ultra-low light conditions, the details are retained well and the shimmer on the steps is actually indicative of what I could see with my naked eye. The colour reproduction, is also on point for the most part.

In ultra-low light conditions with the primary camera, the colour reproduction is on point, details are well retained and the overall lighting is also decent. A slightly lower shutter speed could do more justice to the actual lighting condition of the space. With the ultrawide camera in low light, The detail retention is great. I was shooting a picture of a car, and the lines on the body of the cars and the reflections on their glasses are handled well. The primary camera in low light conditions was faced with a bright light which was challenging to handle but the phone compensated well. Quite a bit of details retained in the overall scene.

In well lit environments, the colours and details are very well captured by the phone's primary camera. The bokeh is also nice with the edge detection able to handle the stay hair strands well.

When you switch to the 2x zoom mode in a well lit environment, details are well retained, but when you zoom in and look at some of the more intricate textures on the saris, the phone struggles to replicate them as one would want. In darker environments, the detail retention is similar to that of the 1x zoom shot, great! There was a bit of lens flare which I had to mitigate and it took a couple of attempts for the phone to get the shutter speed and ISO dialled in.

I noticed no fish-eye effect on the fringes of the image, which is good when clicking pictures with the ultra-wide camera. The colours and details are well retained by the phone but when you zoom

in, you can see it struggling with some textures. In portrait shots with the primary camera, the edge detection is not what I was expecting, but the details on subject's face are well retained and it does well overall. When taking selfies in low-light, detail retention is nice and the extra light added by the phone's screen helps with the shot a lot. The skin tones are also well reproduced. In well lit selfies, there is not a lot of smoothening, the colours are well reproduced, and the overall image looks crisp and sharp.

When it comes to video, the stabilisation surprised me. In terms of colour and detail, you can expect similar performance to that of the phone's primary camera in well-lit conditions.

BATTERY LIFE

The phone should suffice you a day with ease with medium usage, with some charge left before you plug it in when you are sleeping for the night. There's not wireless charging, which is something I would have really appreciated on the phone.

VERDICT

The Vivo T3 Ultra makes for a great device overall, providing value for the money that you spend on it. The design is premium, and the phone has a great in-hand feel. It performs better than other similarly priced devices in synthetic benchmarks and holds its own in the camera department as well. The night photography of the phone could have been better, and the ultrawide camera pales when tasked with capturing complex textures. The battery life of the phone is also decent and it makes for a great device overall for what it's worth. If you are willing to take the plunge right at launch, you will not be disappointed to have the phone as your daily driver.
