

listening to tracks like Uptown Funk by Bruno Mars, where I felt the bass to be lacking a little bit. Even tracks like Rescue Me by OneRepublic threw me off, and I had to go into the EQ to change the preset to Mid-Boost, which brought back the crispy vocals that are present on the track.

However, when it comes to the imaging of the vocals and stereo separation, these headphones hit the ball out of the park.

I experienced some of the best stereo separations in this price range on the Marshall Major V. I took them out for a spin in a game of Rise of the Tomb Raider, and these headphones blew me off with the accuracy of their directional audio. Additionally, the imaging of the vocals in movies and that of the meal instruments is something that you definitely will be a fan of if you get to experience these headphones. The arrival of these headphones at the Digit Test Labs coincided with the return of Linkin Park, and I couldn't stop myself from rocking out to their tracks with these headphones!

The bottom line with these headphones is that if you are a fan of music that has a lot of sibilants and bright

vocals, for example, genres like metal, rock, and classical, you will be pretty impressed by what these headphones have to offer right off the bat. For others, you will have to tinker with the EQ to dial in the right settings to ensure that you are getting the best out of them.

BATTERY LIFE

The Marshall Major V headphones are one of the longest-lasting headphones that I have ever come across. They claim to have a battery life of over a 100 hours, and during my time of using these

headphones and testing them with the volume set to 50 per cent, they lasted about 80 odd hours, which is impressive. A lot of this success in terms of battery life can be attributed to the lack of ANC. However, we have seen headphones without ANC last for a significantly shorter period of time than the Marshalls. So, kudos to the brand!

These headphones also have wireless charging baked into them, which is a plus, and when you are out of charge, you can juice up these headphones, as claimed by Marshall, to get up to 15 hours of battery life in just 15 minutes of charge. And, if you are a purist, and would like to go the wired route, then there's the included AUX cable as well.

VERDICT

The bottom line with the Marshall Major V is that these headphones, while not being the best value-for-money device in this price range, do hold their own. They come with exceptional battery life and a fairly versatile sound signature, which, in daily use, would fit the bill for most people.

There is something left to be desired for the purists and the folks who would expect these headphones to hit the mark right off the bat, considering they are from Marshall; however, if you are willing to tinker with the EQ, you can dial in the performance of these headphones to meet all your expectations.

At ₹14,999, they might be slightly heavy on the pocket for some, in which case, you can look at the Sony WH-CH720N. They have an over-ear design, come with ANC, powerful sound, and great battery life in their weight class.

FEATURE	REMARKS
Equaliser	Having an EQ built into the companion app of an audio device is always handy. The Marshall Bluetooth App has a pentaband EQ which lets you create your own EQ curve and customise the sound to your liking. Definitely a nice to have. There are five preset modes with the option to add a custom curve.
M-Button Customisation	From the app, you can control the function of the Marshall M-button. At the time of writing, there were four options to choose from, which seemed a little constricting. Nevertheless, the more customisation options, the better. One option that stood out was the Equaliser option, which is a nice addition.
Battery Preservation and Standby	Marshall's primary focus on these headphones has been battery life. They claim to have a 100+ hour battery life on these headphones. More on that later. Within the app, you get the option to choose a custom plan to preserve the battery of your device, ensuring longevity. Way to go! Additionally, you get to choose the standby timeout on the headphones, which is pretty neat.
