

Sennheiser HD 620S

A pair of headphones that's worth the price!

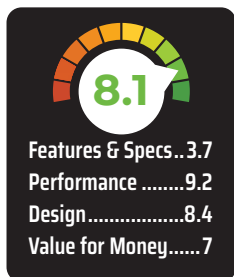

₹27,990

After streamlining its primary focus on professional-grade audio products, Sennheiser has launched quite a few headphones that have impressed consumers in India and pushed the boundaries of innovation. The first one that comes to mind is the Sennheiser HD 490 Pro. That pair of headphones still stands as one of the best pairs for daily use that I have come across. With their swappable earpads, the headphones not only appealed to the purists but were also appreciated by everyday users who would want a slightly bass-heavy response from their headphones. The Sennheiser HD 620S comes in right after that launch, with the promise of continuing the same multi-user appeal with them.

In their marketing material for the headphones, Sennheiser pushed the HD 620S as a pair which can emulate the performance of a pair of open-back headphones despite having a closed-back design. Additionally, they also positioned it to be a perfect fit for gamers and audiophiles alike. Floating on these lofty claims, the Sennheiser HD 620S made its way into the Digit Test Centre, and I put it through our test process to see whether or not they lived up to the expectations. Here's what I found out –

BUILD AND DESIGN

If you have read my review of the last few Sennheiser products, including their consumer-grade products, one thing that you will find me raving about is their build quality. That is the same with the HD 620S. At first glance, they come across as a bulky pair that would cause headaches after a few hours of

use. However, when you put it on, it is not the case.

These headphones weigh 670 grams, almost 1.5x more than any other pair that we have tested in the last couple of years. However, thanks to the amazing fit and the quality of the padding that has been used on these headphones, wearing them for extended periods of time is not at all uncomfortable. The earcups create a nice seal, assisting with the isolation of these headphones, and the padding on the headband ensures that they don't dig into your skull.

When it comes to the build quality, these headphones carry the torch lit by their design team with all the glory. The housing of the earcups and the headband is made of solid plastic, which feels durable. To add to the overall sturdiness of the headphones, we get an aluminium in-lay in the headband.

This is where my only gripe with the build of the headphones is – They are a little stiff to adjust. The adjustment mechanism has a fluid flow; however, it takes more force than I expected to make the adjustments.

Apart from that, Sennheiser did a solid job in the build and design department of the HD 620S.

PERFORMANCE

Usually, this is where you will find the features section of our reviews. However, with professional-grade headphones, you don't get all the fancy bells and whistles that we see on consumer products. Hence, I skipped out on that. One thing that I would like to mention, though, before diving into the performance review of the Sennheiser HD 620S, is the cable that is included with these headphones is great for both professional and day-to-day use.

Sennheiser has included its signature locking mechanism on the end of the cable that goes into the cans and a threaded connector on the end that goes into the source, which can be adapted from 3.5mm to a quarter-inch jack with the included adapter.

With that out of the way, let's dive into the performance.

When it comes to the sound signature, the we get what I call the Sennheiser sound. The lows and the mids come fairly close to our baseline flat response which we recorded using Pink Noise, and the highs are boosted to give the sound a brightness which no manufacturer does better in my opinion. In isolation, this sound is what you would expect from a pair of Sennheiser headphones, and the detailing and the staging is also similar to what I would get from a pair of closed back headphones – intimate and detailed.

The clarity of instruments is what you would expect from a pair that is meant to be carried to a studio and would fit the bill for almost every environment that it is put in. The headphones performance is also consistent and the snug fit of the cans ensures
