

Motorola Razr 50

A solid foldable for the budget conscious

Motorola's Razr series has long been synonymous with innovation in the world of foldable phones. The latest addition to this storied line is the Motorola Razr 50, a device that aims to blend cutting-edge technology with classic design elements. Unlike its high-end sibling, the Razr 50 Ultra, this model positions itself as a more accessible option while still offering impressive features, such as a sizable 3.6-inch cover display. However, it also faces stiff competition from other high-profile foldables like the Samsung Galaxy Z Flip6 and the OPPO Find N3 Flip, which set high standards in performance and design. In this review, we will delve into the Motorola Razr 50's build quality, display, performance, software, camera capabilities, and battery life to determine if it lives up to the expectations set by its Ultra counterpart and rivals.

BUILD AND DESIGN

The Motorola Razr 50's design is both sleek and functional, building on the aesthetic foundation laid by the Razr 50 Ultra. At first glance, the Razr 50 resembles its more premium counterpart with its elegant lines and modern touches. The phone's aluminium frame and stainless steel hinge contribute to a robust build quality, which is further bolstered by an impressive hinge rating of 400,000 folds.

The Razr 50 sports a vegan leather back, which not only adds a touch of luxury but also provides a comfortable grip. The phone is available in three attractive colours: Spritz Orange, Beach Sand, and Koala Grey, each offering a unique look. An IPX8 rating means that

the Razr 50 can handle submersion in up to 1.5 meters of water for 30 minutes, adding a layer of protection against the elements.

One notable change from the Razr 50 Ultra is the front display design.

While the Ultra model features a continuous screen that spans the entire front, the Razr 50 has a thicker top bezel. Despite this, the Razr 50's 3.6-inch cover display is a significant upgrade from the Razr 40's diminutive 1.5-inch screen. This larger display allows for greater functionality and usability, enabling users to run a wide range of apps directly from the cover.

DISPLAY

The Motorola Razr 50 is equipped with a 6.9-inch foldable LTPO AMOLED inner display that excels in brightness and colour accuracy. With a tested peak brightness of 1582 nits (in HBM), the screen remains highly readable even

under direct sunlight. The display's 120 Hz refresh rate provides smooth scrolling and transitions, and it intelligently adjusts based on the app in use to optimise performance and battery life.

The outer display, measuring 3.6 inches, is the largest of its kind in the current flip phone market, surpassing even the Samsung Galaxy Z Flip6's cover screen. It supports 90 Hz refresh rate, although it defaults to 60 Hz for Always On Display functions, which can impact battery life. Nonetheless, the outer display is protected by Corning Gorilla Glass Victus, giving it added durability and resistance to scratches. Its size allows for practical use of apps and notifications, though it may feel a bit cramped for extensive texting.

Overall, the Motorola Razr 50's display delivers impressive performance with its vibrant colours and high brightness, making it a standout feature of the device.

PERFORMANCE, SOFTWARE, AND AI

Performance is a mixed bag for the Motorola Razr 50. The device is powered by the MediaTek Dimensity 7300X processor, a chip typically found in mid-range phones. This choice of processor places the Razr 50 in a challenging position, especially when compared to competitors like the Samsung Galaxy Z Flip6 and the OPPO Find N3 Flip, which boast more powerful internals.

In benchmark tests, the Razr 50 falls short of its higher-end rivals, struggling to keep pace with even more affordable candybar phones like the Realme GT 6. This performance gap becomes apparent during daily tasks as well, with the phone showing signs of lag during intensive operations such as photo and video capture. Gaming performance is also affected, with noticeable frame drops during extended play sessions on high settings.

On the software front, the Razr 50 runs on Hello UI, which offers a streamlined and user-friendly experience with minimal bloatware. The
