

world-class engineering teams. Today, Tessolve has grown into the largest standalone semiconductor solutions provider, with over 3,000 engineers across 10 countries.

Along with an end-to-end service model, covering everything from chip design and testing to product engineering and systems design, our deep expertise in ARM-based SOCs, HSIO (high speed IO), managing 500w+ devices, and testing for defects at 3nm differentiates us from other engineering service providers in the industry, positioning us as a key player in advancing semiconductor technologies worldwide.

Q Could you elaborate on Tessolve's current initiatives in AI chip development?

A With the rapid rise of AI chips, the complexity of design and testing has grown significantly. To stay at the forefront of these advancements, Tessolve has established a Center of Excellence focused on cutting-edge technologies to ensure we are well-prepared to meet the demands of emerging technologies.

AI chiplets, in particular, have become increasingly important, and we have invested heavily in enhancing our design capabilities for Design Verification for UCle interface (this is almost a must-have) chiplet DFT, advance packaging for silicon interposers, and testing. We've also invested in the latest testers capable of handling the complexities of AI chip testing. These strategic investments are already yielding positive results and positioning us as a key player in the evolving AI landscape.

Q What are some of the key technological advancements that Tessolve has implemented in AI chips?

A At Tessolve, we've focused on key advancements in AI chips by enhancing analog designs for high-performance IVRs, and significantly improving our ATE capabilities and data collection. Our expertise in high-power device testing and reliability through ATE has been crucial, especially for advanced nodes and high-power applications. We've also

led the way in UCle package designs, driving innovation for scalable ARM-based SoC solutions, while ensuring reliability and performance.

Q Could you discuss strategic partnerships Tessolve has established with AI chip designers and other stakeholders, and how these collaborations are driving innovation?

A Tessolve has formed strategic partnerships with AI chip designers and industry leaders, functioning almost like their extended engineering arm, spanning across the entire product lifecycle, from chip design to post-silicon testing, and product engineering. Through our collaboration with companies like SigmaSense and Renesas, we have developed advanced solutions for various applications such as industrial robotics. Our expertise in AI chiplet design, high-power device testing, and UCle interfaces, when combined with these key partnerships, help us deliver groundbreaking innovations and deliver highly specialised AI solutions tailored to industry needs.

Q What are some major challenges Tessolve faces in the rapidly evolving AI chips domain?

A At Tessolve, we believe in the philosophy that every disruptive technology presents a unique set of challenges and viewing them as opportunities is the key to sustain the organisation in the long run. Presently, one of the major challenges we are facing in the AI chip domain is the rising cost of advanced technology development. Additionally, ensuring that our engineers possess the necessary skills to adapt to rapidly evolving technologies is also demanding. However, we strongly believe that the opportunities

outweigh the challenges with AI driving the demand for sophisticated chips, which has boosted the need for design, testing, and validation services.

This provides significant growth and expansion opportunities for Tessolve, with the increasing volume of designed and tested AI chips presenting a thriving business landscape. Our focus remains on seizing these opportunities, staying at the cutting edge of innovation, and continuing to support the industry's growing needs, positioning ourselves for sustained success in this evolving field in the process.

Q As AI continues to evolve, what is your vision for the future of AI chips?

A As AI continues to evolve, the semiconductor industry is at a major inflection point, with new standards and approaches being established. Leading companies – such as Tesla, Google, Microsoft, and Ola – are now focusing on developing their own custom silicon, underscoring the trend of the growing importance of chip design in national and global ecosystems. If data was once considered the new oil, then chips have become the new data, driving innovation and competitive advantage across industries.

At Tessolve, we are positioned for accelerated growth as this shift towards custom silicon deepens, as companies developing their own AI chips will increasingly seek the support of partners like us, who bring expertise at scale in design, testing, and development. This surge in demand for customised solutions will require more testing and the need for skilled engineers, which will not only drive Tessolve's growth but also contribute to the advancement of the broader industry. **d**
