

we offer a fully integrated solution that combines security and convenience, surpassing what standalone products on the market provide.

For example, Mygate Locks come with a Tamper Alert feature that can instantly notify relevant authorities, such as the security guard at the gate, in addition to alerting the user in case of tampering. Moreover, our locks allow for recurring timed access, making it easier for daily help to enter the home at set hours, which adds an extra layer of convenience for residents.

The synergy between Mygate Locks and the Mygate app is a core differentiator. Our locks seamlessly integrate with the app, enabling users to manage both their community gate access and home door from a single platform. This experience includes features like real-time notifications, remote access, and scheduled access for daily help, all designed to make adoption smoother and more attractive. And since our app is already a part of daily life for millions, this integration streamlines the onboarding process for smart locks.

**Q What future product offerings can we expect from Mygate, and how do they align with the company's core values and mission? Currently, what portion of the addressable apartment market in India does Mygate cover, and what strategies are in place to reach and serve the remaining market?**

**A** Looking ahead, we are expanding into the broader smart home ecosystem with integrated devices such as security cameras, video doorbells, and home automation solutions. Each of these products is designed to work seamlessly within the Mygate ecosystem, enhancing security, convenience, and the overall living experience in a unified platform. This approach aligns with our core values of fostering a safe, connected community and delivering a smooth, user-friendly experience from a single app.

In terms of market penetration, we currently serve over 25,000+ communities across India, covering a significant portion of the addressable apartment market. However, there is substantial potential for growth. Our strategy includes expanding into Tier 2 and Tier 3 cities, where gated community living is on the rise, and extending our solutions to individual homes, so more people can benefit from our technology. This integrated approach not only addresses the needs of large communities but also offers a consistent, high-quality experience across different residential setups.

**Q As a technology-driven company, how is Mygate leveraging artificial intelligence in its current offerings, and are there plans to introduce AI-led solutions in the future? As the founder and CTO, where do you envision Mygate five years from now? Will the focus be more on expanding market coverage, or on bringing innovative products and solutions to the market to stay ahead of technological trends?**

**A** Currently, Mygate uses AI to unlock efficiency in development and to enhance customer support, with a significant number of queries now handled directly by AI agents. Our goal is to have AI resolve up to 90% of support questions in the near future. At the same time, we're experimenting with AI models to enhance community life. We have been working on creating an AI

community helper. For example, a problem that is often faced is in managing community WhatsApp groups, with frequent move-ins and move-outs, and new residents often rely on others to introduce them to the right group. AI-driven solutions to manage the chat groups within Mygate can allow communities to simplify this process, making community integration smoother. Another POC we are doing is a community AI knowledge bank which can suggest the best pediatric doctor around and the best eatery nearby, all based on community discussions.

Reflecting on our journey, we've consistently expanded market coverage while driving continuous innovation. We believe that growth and innovation go hand-in-hand; without innovating, we cannot grow.

**Q Given that Mygate handles a significant amount of user data, how does the company utilize data and insights to create and enhance its products and services? What measures are in place to ensure user privacy and data security while leveraging this data for innovation?**

**A** Customer experience is at the heart of what we do, and data-based insights allow us to refine our products and develop new services that cater to the evolving needs of our users. For instance, we use data to optimize security features, improve delivery management, and tailor our app's user experience.

When it comes to data privacy and security, we take a rigorous approach. All user data is encrypted, and we follow industry-leading standards such as ISO 27001 for data security and are DPDP-ready. Additionally, all our data is stored within India on secure Mygate servers. We are committed to maintaining the trust our users place in us, and we ensure that any data used for innovation is anonymized and handled responsibly, with strict privacy controls in place. **■**
