

PRITHVI

CLIMATE AI MODEL

Meet Prithvi, NASA & IBM's free AI model for better weather prediction

Well, AI is here too!

Jayesh Shinde | jayesh@digit.in

When I heard that NASA and IBM had teamed up to release an open-source AI model for weather and climate applications, somehow it didn't feel like just another tech announce-

ment. At a time when all of us here in India (and around the world) are increasingly at the mercy of freak weather events and climate change, Prithvi WxC – the name of the open-source AI model jointly released by NASA and IBM – could be a significant moment.

Combine NASA's data with the ingenuity of the open-source community and Prithvi WxC could be a

significant leap forward in democratising how we understand and predict our planet's complex climate systems. But what exactly is this AI model, and how might it change the landscape of climate science?

What exactly is Prithvi WxC AI model

NASA and IBM have co-developed a foundation AI model named Prithvi WxC, which is designed to tackle a range of weather and climate challenges. Unlike traditional models that focus on specific datasets or single use cases – primarily forecasting – this model is much more versatile. It's been trained on a relatively small cluster of 64 NVIDIA A100 GPUs with 40 years of high-quality Earth observation data from NASA's MERRA-2 dataset, making it robust and comprehensive.

"We designed our weather and climate foundation model to go beyond limitations so that it can be tuned to a variety of inputs and uses," explains Juan Bernabé-Moreno, Director of IBM Research Europe, in an official
