Subject: Re: Re: AC

Body:

Home: Reaching in 30 minutes

AC: 26°C after 30 minutes

AC: 28°C after 45 minutes

This way you can comfortably set the temperature during your commute and enjoy coolness at your home when you actually reach there.

Email is just one way to achieve this. A similar exchange of information could also happen via a text message.

Alternatively, since internet-connected smartphones are on the rise, all you may need to do is launch an app and check the temperature of your house. You can then set the time you'll reach home and the required temperature.

This could also be possible...

Much more compact devices such as smartwatches that can monitor your heart rate and body temperature can sense the changes in body temperature and heart rate to judge the level of physical activity at which you're performing. The smart device can then connect to your AC, which receives similar data from other people in the room

to decide the direction of airflow and the required coolness. This way, you feel neither too cold nor too hot, and your electricity bill is reduced as well.

In the near future, everything around us will be connected to everything else and us. This phenomenon of the Internet of Things will enable things around us to change the way we live. The ability to remotely control factors such as the usage of available resources, their continuous monitoring and optimisation will help us enjoy a better standard of life. 

An app that does it all
